Cromlech

2875-77

There are remains of three cromlechs here, ranged slightly north-west to south-east in a line. The north cromlech is fallen down, but there are remains of two uprights standing. The capstone is lying on the ground, and measures about 10 ft 6 ins long and about 6 feet wide. The middle cromlech has one leg standing, and the remains of another upright, but the capstone has disappeared. The capstone of the south cromlech is lying on the ground, and measures 6 feet by 5 feet. There are three uprights (one 6 feet high) standing, and another lying down.
