Crynodeb

Comisiynwyd Archaeoleg Brython gan Horizon Nuclear Power Ltd. (HNP) i gyflawni rhaglen o waith cloddio archaeolegol rhwng 2017 a 2019 yn ystod gwaith clirio cynnar cyn cyflwyno cais Orchymyn Cydsyniad Datblygu (OCD/DCO) ar gyfer Orsaf Bŵer Wylfa Newydd ar Ynys Môn, Gogledd Cymru.

Wedi cwblhau'r cloddio commisynwyd Wardell Armstrong LLP. ac Archaeoleg Brython gan HNP i ddarparu crynodeb o ganlyniadau'r gwaith ac i gyflawni rhaglen o waith ôl-gloddio rhwng Medi 2019 a Mawrth 2020 i asesu arwyddocâd a photensial yr archif a'r darganfyddiadau.

Adroddiad Asesiad o Botensial yw'r ddogfen hon ar gyfer archif a chasgliad arteffactau safle Hotspot 8 a gloddiwyd fel rhan o'r gwaith clirio cynnar.

Roedd cloddfa Hotspot 8 (NGR SH 34909278; EVENT PRN 46041) yn mesur 375m² ac wedi ei leoli i asesu potensial y safle yn dilyn arolwg geoffisegol ac arolwg ffosi gan Wessex Archaeology. Yn ystod y gwerthusiad nodwyd bedwar pydew.

Yn ystod cloddio darganfyddwyd 12 pydew, dau dwll postyn, dwy ffos a llwyfan o gerrig. Darganfyddwyd sidell, darn o glai llosg a gwastraff diwydiannol. Mae'n debygol bod y pydewau a'r tyllau pyst yn cynrychioli ysgubor debyg i esiamplau o safleoedd archaeolegol eraill.

Mae dyddiadau radiocarbon yn awgrymu dyddiad Neolithig i'r ffosydd a dyddiad Oes Haearn Hwyr i'r ysgubor.

Summary

Brython Archaeology, commissioned by Horizon Nuclear Power Ltd. (HNP), undertook a phased programme of excavation in 2017-2019 in advance of the submission of a Development Consent Order (DCO) application for the construction of the proposed Wylfa Newydd Power Station on the Isle of Anglesey, North Wales.

Wardell Armstrong LLP. (WA) and Brython Archaeology was subsequently commissioned by HNP to provide a summary of the results of the archaeological excavation and to undertake a programme of post-excavation during September 2019 to March 2020 to assess the significance and potential of the site archive and finds.

This is an Assessment of Potential Report of the archive and finds assemblage of Hotspot 8, which was excavated during early clearance works.

The excavation area of 375m² at Wylfa Hotspot 8 (NGR SH 34909278; EVENT PRN 46041) was defined following a geophysical survey and archaeological trial trench evaluation by Wessex Archaeology to address the archaeological potential of the site. During evaluation four pits were identified.

During the excavation 12 pits, two post-holes, two ditches and a stone platform were revealed. Based on similar features from other excavated sites it is likely that the pits and post-holes represented a granary. One spindle whorl, a fragment of fired clay, and industrial waste were recovered during the excavation.

Radiocarbon dating of organic material recovered from soil samples indicated that the ditches date to the Neolithic and the potential granary feature to the Late Iron Age.

1 Introduction

During August 2017 to January 2019, Archaeoleg Brython Archaeology CYF. (ABA), commissioned by HNP, conducted a phased programme of excavation of two ditches, two potential postholes and twelve pits at Wylfa Hotspot 8, Anglesey (NGR SH34909278) in advance of the submission of a Development Consent Order application (PINS reference number EN010007) for the construction of the proposed Wylfa Newydd Power Station. The excavations at the Wylfa Newydd development site (EVENT PRN 45392) involved 30 open area excavations, with some undertaken as set piece excavations and others as strip map and sample excavations. In total 32 strip, map and sample areas, described as 'Hotspots' were identified, and organized into four zones referred to as 1a, 1b, 2 and 3 within the Written Scheme of Investigation (WSI; Horizon Nuclear Power, 2016; 2017). Fourteen of these areas were excavated by ABA totalling an area of approximately 25,578m² (*Figure 1*):

- Wylfa Head (EVENT PRN 46035)
- Area 7 (EVENT PRN 46036)
- Area 8 (EVENT PRN 46037)
- Hotspot 5 (EVENT PRN 46038)
- Hotspot 6 (EVENT PRN 46039)
- Hotspot 7-9 (EVENT PRN 4640)
- Hotspot 8 (EVENT PRN 46041)

- Hotspots 10 (EVENT PRN 46042)
- Hotspot 11-13 (EVENT PRN 46043)
- Hotspot 12 (EVENT PRN 46044)
- Hotspot 14 (EVENT PRN 46045)
- Hotspot 15 (EVENT PRN 46046)
- Hotspot 16 (EVENT PRN 46047)
- Hotspot 17 (EVENT PRN 46048)

Two supplementary excavation areas, Hotspot 8B and Hotspot 15 West, were opened to investigate the interaction between the archaeology in Hotspot 8 and Hotspot 15. This phase of fieldwork was concluded in January 2019. In February 2019 it was announced that the Wylfa Newydd project was being put into a suspended state. As a result of this all further works on the site have been suspended.

Prior to the excavation of the Wylfa Hotspot 8 site, it had been subject to an archaeological Desk Based Assessment (DBA) (Cooke *et al.*, 2012), magnetometer geophysical survey (Hopewell, 2011a; b; Hopewell 2012) and a programme of evaluation trenching by Wessex Archaeology (2016). During the evaluation four pits were identified. Excavation of Hotspot 8 (EVENT PRN 46041) by ABA revealed the remains of 12 pits, two postholes, two ditches and a stone platform. It was suggested that the features may relate to the edge of settlement activity associated with Romano-British archaeology identified in Hotspot 15 located approximately 32mto the east (ABA, 2021b).

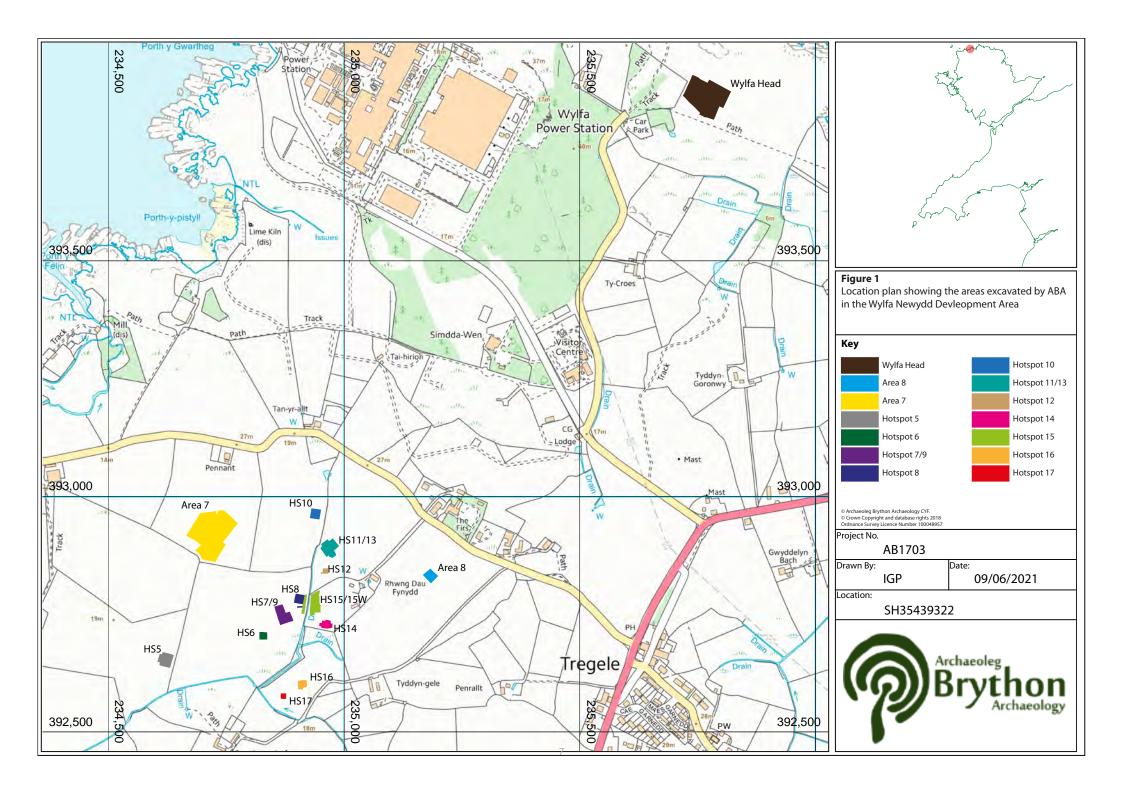

All archaeological works were undertaken in accordance with the Written Scheme of Investigation (WSI [Horizon Nuclear Power, 2016; 2017]), and in line with paragraph 5.8.21 of the overarching National Policy Statement for Energy (EN-1 [Department of Energy and Climate Change, 2011]). The work was monitored by Gwynedd Archaeological Planning Services (GAPS), cultural heritage advisors to the Local Authority. WA have been employed by the HNP as cultural heritage consultants for the project and within this capacity have provided guidance and advice during the works. The key historic environment stakeholders are:

- Cadw The principal Welsh government body responsible for the historic environment of Wales; and
- GAPS The curators responsible for monitoring archaeological investigations undertaken as part of development in the region.

During the fieldwork and post-excavation work an archaeological record and archive of the site, AB1703 Hotspot 8, was created. WA was appointed by HNP to undertake a programme of assessment of the archaeological potential of the evidence accumulated during the excavations

and ABA was selected to undertake a portion of this work under a sub-contract agreement with WA. The excavated finds and environmental samples were handed over to WA in April 2019.

The purpose of this document is to report on the post-excavation assessment of the Hotspot 8 archive and finds assemblage, and to create an ordered archive for deposition. This report is written and structured to conform to MoRPHE guidelines, the Charted Institute for Archaeologists standards required of post excavation assessment (ClfA 2014a; 2014b), and in line with the recommendations as stated in the ABA site summary report (ABA, 2018). Digital copies of this report are to be submitted to HNP and relevant stakeholders. The archive and finds assemblage were stored in accordance to ClfA's standards and guidance (ClfA, 2014a: 2014b) while under the curatorship of ABA. The paper archive and digital data, including photographs will be lodged with the Royal Commission on Ancient and Historical Monuments of Wales (RCAHMW) in Aberystwyth on completion of the project. ABA will hold a digital version of the archive indefinitely.

2 Project Background

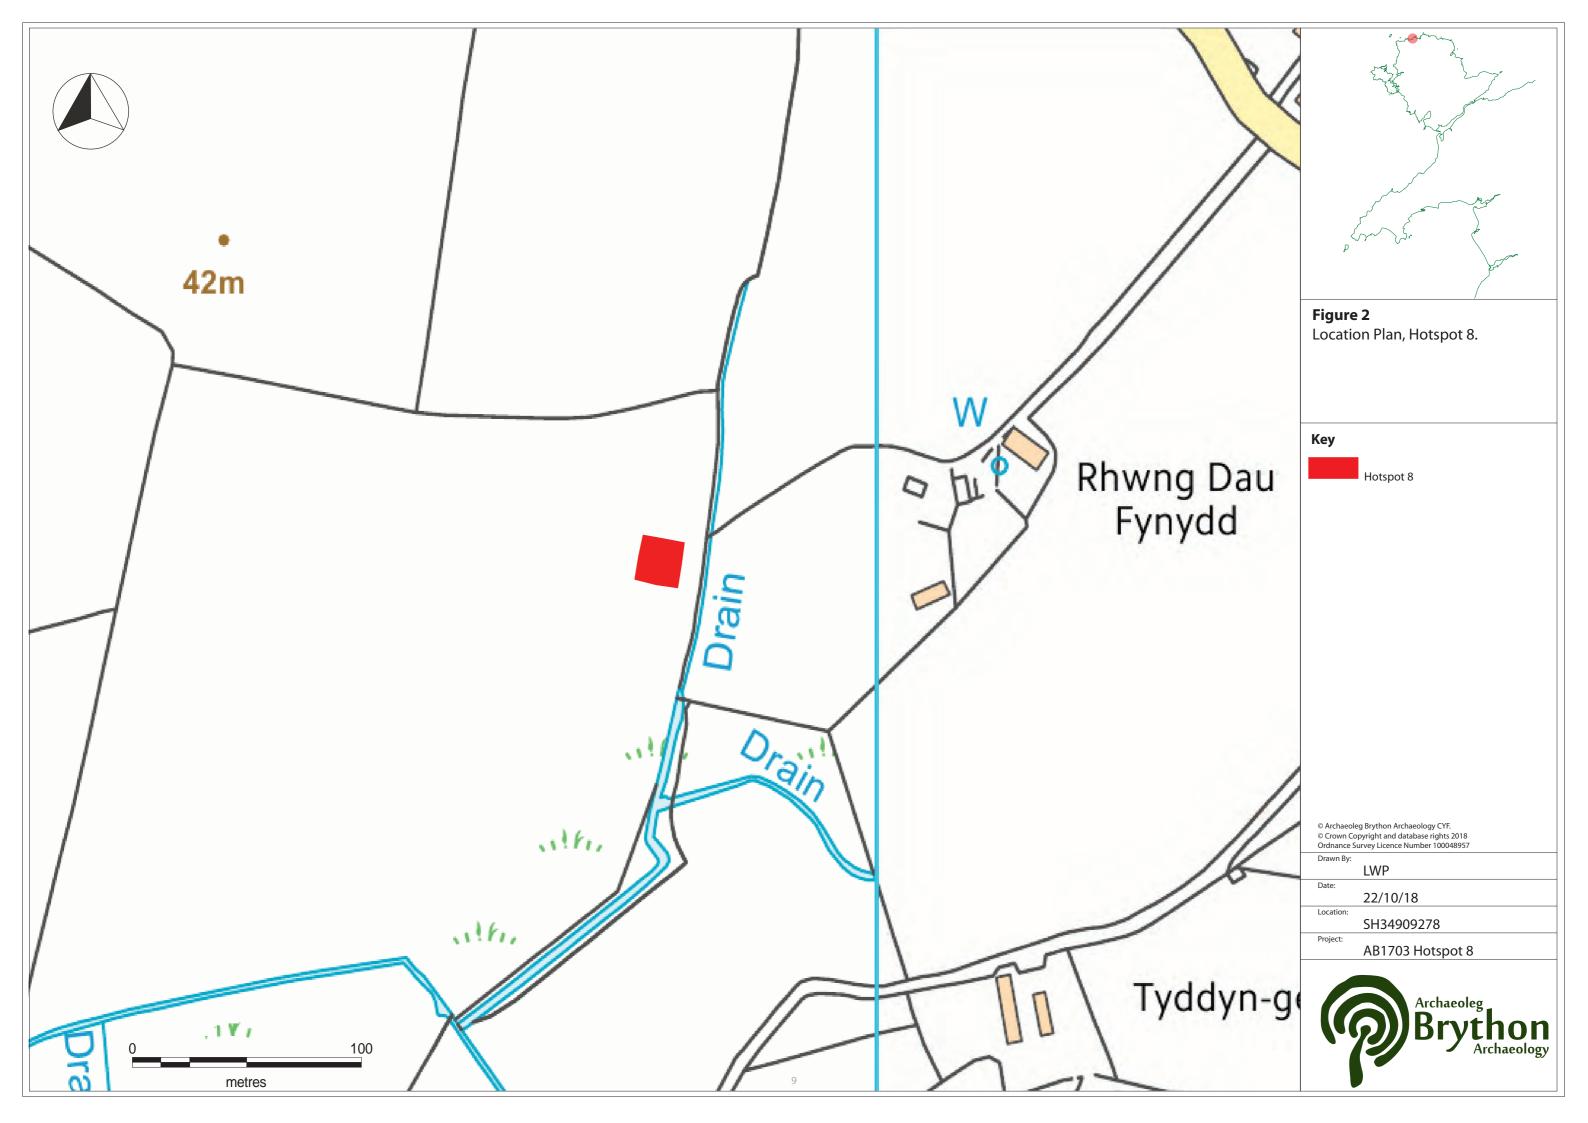

2.1 Site Location

Hotspot 8, located in Hotspot Zone 1a, was located approximately 700m west of Tregele and 900m south of the existing decommissioned Wylfa power station in a low-lying field. The pastural field was previously labelled 'A7' during the archaeological trial trench evaluation (*Figure 2*). A post-medieval drainage ditch was located approximately 8m east, which drained to a marshy area to the south. The investigation area was at a height of approximately 16m AOD, centred on NGR SH34909278, and measured approximately 375m².

Due to the proximity of a large amount of intensive Romano British archaeological activity in Hotspot 15 (located approximately 32m east of Hotspot 8), two supplementary excavation areas, Hotspot 8B and Hotspot 15 West, were later opened to determine the extent of the interaction between the archaeology in Hotspot 8 and Hotspot 15. Hotspot 15 was located east of Hotspot 8, beyond the modern drainage ditch, on relatively flat ground at the base of a south-westerly sloping field labelled 'A12' during the evaluation. Hotspot 15 West and Hotspot 8B were located in the field previously labelled 'A7', immediately east of Hotspot 8 (*Figure 1 and 3*). The results of the excavation of Hotspot 15 and Hotspot 15 West are discussed in the Hotspot 15 Post-Excavation Assessment of Potential Report (ABA, 2021b).

2.2 Geology and Topography

Superficial deposits in the area consist of Till, Devensian – Diamicton. These are sedimentary deposits which formed between 11.6 and 11.8 thousand years ago during the Quaternary period, indicating a landscape dominated by Ice Age conditions. The underlying bedrock geology consists of Mica schist and psammite of the New Harbour Group. This is a metamorphic bedrock which formed between 635 and 541 million years ago during the Ediacaran period. These rocks were originally sedimentary, formed in deep seas, later altered by Iow-grade metamorphism (BGS, 2019).

2.3 Archaeological and Historical Background Data

Historic mapping and documentary sources consulted by ABA did not indicate the presence of the remains of pits, ditches or other archaeological features identified during the excavation of Hotspot 8. However, Anglesey is rich in archaeological sites and artefacts dating from the Mesolithic to medieval period. The information below is summarised from reports and archaeological baseline assessments (Cooke *et al.*, 2012; Parry *et al.*, 2012; Jacobs, 2015; Wessex Archaeology, 2016; ABA, 2017; Headland Archaeology, 2018).

Mesolithic finds in the area generally consist of flint scatters and tools located at a number of locations across Anglesey, generally close to water sources and often at coastal locations. The nearest possible Mesolithic activity recorded is at Cemlyn Bay, located approximately 2km to the west of the existing decommissioned Wylfa power station, in the form of flint scatters (HER PRN GAT 31584). Another discovery of three blade-like flint flakes (HER PRN GAT 7046) is recorded approximately 8km to the south near Llyn Alaw. Two possible Mesolithic lithic scatters (HER PRN GAT 91809/ HER PRN GAT 91811) were identified during the early clearance works at the Wylfa Head excavation area, approximately 350m east of the existing decommissioned power station.

Evidence for Neolithic activity in the area is abundant, mostly represented by megalithic funerary monuments, including chambered and passage tombs. These tombs would have been held the remains, both skeletal and cremated, of numerous individuals of the early farming communities which constructed them. Such monuments were often in use for long periods of time spanning both the Neolithic and Early Bronze Age periods, some examples show evidence of rearrangement and alteration to accommodate changing funerary practices. A ruined chambered tomb (HER PRN GAT 3046) is located approximately 1.8km to the south-east at Llanfechell. A limited number of domestic sites have been recorded on Anglesey, with the closest being the Early Neolithic settlement at Llanfaethlu, located approximately 8km south-west of the existing decommissioned Wylfa power station. The settlement of at least three Early Neolithic houses is the first of its kind to identified in Wales and one of the first in the UK (Rees & Jones, 2015). Evidence of Neolithic activity was identified during the early clearance works at the Wylfa Head excavation area where a group of stone axes and polishing tools were identified in a pit (HER PRN GAT 91812).

Few Bronze Age settlements have been identified on Anglesey but evidence of activity during this period, such as barrow and cairn construction and erection of standing stones, remains visible in the landscape. During the Bronze Age, settlements become apparent on high, defendable ground suggesting the establishment of centres of power, likely organised into tribes or clans. During early clearance works an undefended Bronze Age roundhouse (HER PRN GAT 91868) was identified at Hotspot 14. The nearest Scheduled Monument dating to the Bronze Age is Meini Hirion (AN 30), a group of three standing stones, which may form part of a Prehistoric complex along with the previously mentioned ruined chambered tomb (HER PRN GAT 3046), located approximately 2km south-east of the existing decommissioned Wylfa power station. Prehistoric burials in the later part of the period appear to have moved away from the communal tradition with the appearance of individual urned cremations and crouched cist inhumations. Arguably the most common feature type associated with the Bronze Age is burnt mounds. Evidence of these features are plentiful in the region and as many as twenty burnt mound deposits were identified within the footprint of the Wylfa Newydd development area. The closest recorded burnt mound (HER PRN GAT 61102/91837) is located east of Rhwng Dau Fynydd, approximately 1km south of the existing decommissioned Wylfa power station and was excavated in Area 8. Further burnt mounds were excavated in Hotspot 5 (HER PRN GAT 91839) and Hotspot 7-9 (HER PRN GAT 91846) during the early clearance works.

Prior to the commencement of the archaeological evaluation and early clearance works no Iron Age activity had been recorded at the site. The closest recorded Iron Age enclosure (HER PRN GAT

61454) is found north of Penymorwydd, located approximately 4km south-east of the existing decommissioned power station at Wylfa. A number of undated large enclosures and ring-gullies were identified in the development area during the evaluation phase, excavation during early clearance indicates that some of these date to the Iron Age. A partially enclosed hilltop settlement with a single roundhouse and possible granary (HER PRN GAT 91829), dated to the Iron Age, was identified in Area 7. Unenclosed and low-lying Iron Age settlements were also identified at Hotspot 15 (HER PRN GAT 91875) and Area O5 South, occupation of these settlements is likely to have spanned from the Iron Age through to the Romano British period.

The closest evidence of Roman activity to the Wylfa Newydd development site previously identified was a probable fortlet (HER PRN GAT 37976) near Cemlyn Bay, near the western extent of the development area, and Roman coins (HER PRN GAT 998) and brooch (HER PRN GAT 999) found at Cemaes Fawr Farm, located approximately 2km east. During evaluation and early clearance Roman and Romano British archaeology was identified at a number of locations. At Area 4, approximately 500m south of the existing power station, a possible Roman invasion camp (HER PRN GAT 92053) was identified. Iron Age/Romano British settlements were identified at Wylfa Head (HER PRN GAT 91817), Area O5 South, and Hotspot 15 (HER PRN GAT 91875).

Prior to the evaluation and early clearance works evidence of early medieval archaeology within he development area was scant. Few sites of this period have been identified on Anglesey, the majority of known sites are ecclesiastical, including a 9th century cross slab (HER PRN GAT 3059) from Llanbadrig which pre-dates the 12th century church (HER PRN GAT 3052). During evaluation an early medieval cist cemetery (HER PRN GAT 91824) was identified at Wylfa Head, this was fully excavated during the early clearance works. A second cemetery (HER PRN GAT 91830) which included four square funerary enclosures (HER PRN GAT 91831,91832,91833,91834) was identified at Area 7, and a possible group of family graves at Hotspot 11-13 (HER PRN GAT 91862).

Documentary and physical evidence suggests that the area was extensively habited and utilised by the 12th century. The area would have been within the Kingdom of Gwynedd which was subdivided into a number of regional commotes (Cwmwd) which would have had a royal manorial centre (Mardref) to act as a focus for administration and taxation (Cooke et al, 2012). The proposed development area was within the commote of Tanybolion, the Mardref was located approximately 1km east at Cemaes. No medieval settlements have been recorded in the area and the existence of settlements is largely known from documentary sources. Two place names that are however spatially closely associated with the site are:

- Tre'r Gof (township of the smith) documented from the 12th century and is thought to have been a medieval township or hamlet with the commote of Talybolion.
- Wylfa (lookout point) documented from the later medieval period as a farm that was part of the township of Caerdegog.

Although no physical evidence of the hamlets have been identified it is possible that buried archaeology remains below later farms.

Evidence of early post-medieval field systems across the site was identified through desk based assessments, geophysical survey and confirmed during evaluation and early clearance works. Many of these are likely to date to the 16th and 17th centuries and are likely to have been removed in the 19th century during episodes of land improvement and creation of larger fields for new farming techniques. It is likely that much of the land improvement during the 19th century was driven by the estates which held the land, these include Carreglwyd, Plas Coch, Cefn Coch and Bodorgan (Cooke et al. 2012).

Although no large estate houses were ever located within the proposed development area large houses with associated ancillary buildings, landscaped grounds and gardens were constructed at several former farms including Wylfa, Simdde Wen and Cestyll (Cooke et al. 2012).

During WWII a Chain Home radar station (HER PRN GAT 36597/3658) was established at Wylfa Head to identify enemy aircraft and to manage the shipping routes for Liverpool.

The current landscape is dominated by the now decommissioned Wylfa power station which was constructed in the 1960s and was operational until 2015. As well as the present building much of the surrounding area was impacted by the construction of the plant but recent work shows that buried archaeology survives in close proximity to impacted areas.

2.4 Original Geophysical Survey Results

Geophysical surveys were carried out during the assessment of the site (WYAS, 2015; Hopewell 2011a: 2011b; Hopewell, 2012). The surveys did not demonstrate the presence of significant archaeological remains within the excavation area.

2.5 Original Evaluation Results

Archaeological investigations undertaken in 2015-2016 indicated a fairly consistent non-archaeological deposit of 0.1-0.45m of brown sand loam topsoil, overlying 0.02-0.58m of yellow brown silt loam subsoil across Field Group 1, in which Field A7 is located. Natural deposits of orange brown sand or clay lay at 0.2-0.8m below ground level. A total of 54 trenches were opened in Field A7, with 26 of those containing recorded archaeology. Of these trenches, 14 contained undated ditches and two contained undated pits. Alluvial deposits of blue grey clay or grey brown sand clay were recorded up to 0.52m deep in Field A7 (Trenches 254, 261, 264, 1363). A peat deposit of dark grey brown silt with a high organic content was recorded in Trenches 258 and 1357.

Hotspot 8 targeted the location of Trench 1344. The area was noted to be very wet and marshy. The trench was excavated to a depth of 1.0m at its south-western end into alluvial deposits and flooded immediately when breaking ground. A coherent but undated pit group consisting of four pits (13444, 134406, 134408 and 134415) ranging from 0.50m to 0.8m in diameter, and 0.03m to 0.30m in depth were revealed (Wessex Archaeology, 2016).

2.6 Original Aims and Objectives

According to the WSI (Horizon Nuclear Power, 2016: 2017), the general aim of the excavations at the Wylfa Newydd development site was to gather additional information of the extent, condition, depth, character, quality, stratigraphic sequence and date of the archaeological remains within the excavation areas and to preserve the revealed remains, in record, in anticipation that their physical remains may be destroyed by future development works. The results of the investigations are to be disseminated through the deposition of an ordered archive at suitable repositories for both physical and digital material, the deposition of a detailed report at the Historic Environment Record and the production of a publication article, at a level of detail appropriate to the significance of the results.

2.6.1 Archaeological Strip, Map and Sample Aims

- 1. To ensure the adequate recording of any archaeological remains revealed by the strip map and sample work.
- 2. To identify, investigate and record the character, nature, extent and relationships of the archaeological remains discovered, to the extent possible by the methods put forward in the specification.
- 3. To determine (as far as possible) the stratigraphic sequence and dating of the deposits or features identified.
- 4. To integrate the results of the work into the wider historic and archaeological context of the landscape and to address relevant regional research objectives where applicable and so far as is possible.
- 5. To disseminate the results through deposition of an ordered archive at the suitable repositories for both physical and digital material, the deposition of a detailed report at the Historic Environment Record (HER) and publication at a level of detail appropriate to the significance of the results.
- 6. To undertake the works in such a way as to allow sufficient data to be gathered to address the various research objectives outlined below. This includes the investigation and recording of features, the identification, recording and collection of artefacts and ecofacts (including environmental samples) and the use of appropriate analytical methodologies/techniques when examining the record/artefacts.

2.6.2 Archaeological Strip, Map and Sample Objectives

The relevant archaeological framework documents identified in the WSI (Horizon Nuclear Power, 2016: 2017) were:

- Review of the Research Framework for the Archaeology of Wales: North West Wales Neolithic and Early Bronze Age (Burrow, 2010);
- Review of the Research Framework for the Archaeology of Wales: North West Wales Later Bronze Age and Iron Age (Gale, 2010);
- A Research Framework for the Archaeology of Wales Romano British (AD 43-AD 410) (Davies, 2017);
- A Research Framework for the Archaeology of Wales: North West Wales Early Medieval c. AD 400-1070 (Edwards *et al.*, 2016); and
- A Research Framework for the Archaeology of Wales: North West Wales Medieval c.AD 1100 1539 (Longley, 2010).

As settlement activity in the form of pits, postholes, ditches, prehistoric and Romano-British artefacts were recovered during the evaluation and excavation of Hotspot 8, the relevant archaeological research questions stated below were identified in the WSI for Strip, Map and Sample areas (Horizon Nuclear Power, 2017):

Prehistoric;

- Q.1. Are the possible structural features associated with isolated structures or part of a larger settlement?
- Q.4. What relationships or patterns, if any, can been seen between these prehistoric features and their wider landscape setting?

- Q.5. What evidence do the ditch features provide for prehistoric landscape organisation and enclosure?
- Q.7. What relationships or patterns, if any, can been seen between these potential prehistoric features and their wider landscape setting?
- Q.8. What types of artefacts are present in the SMS zones?
- Q.9. What can these artefacts tell us about daily life and ritual activity?
- Q.10. Were those artefacts, which may be found in the SMS Zones, produced locally?

Additionally, there are seven farmsteads within the Wylfa Newydd Development Area (Jacobs, 2015: Assets 119, 146, 154, 173, 225, 263, 286). Land drains and enclosure ditches associated with these farmsteads, as well as other agricultural features and artefacts of a post-medieval to modern date not directly associated with these assets were identified in both SMS zones. Therefore, the following questions should also be addressed:

- Q.11. What can the ditches and land drains tell us about the process of enclosure and land improvement in the post-medieval to the modern periods in the SMS zones?
- Q.12. What evidence is there for the types of farming and land use in this area in the post-medieval and modern periods in the SMS zones?

Romano-British;

- Q.14. How did the culture on the island change, and in what ways, between the Roman and early medieval periods?
- Q.15. What types of Roman Sites are present with the Wylfa Newydd Development Area, and how do they relate to their surrounding landscape both in terms of location and utilisation of the landscape?

2.7 Field Methodology

The investigations were undertaken in accordance with the scope and methodology outlined in the WSI (Horizon Nuclear Power, 2016: 2017), and as described in the Site Summary Report (ABA, 2018). All works complied to CIfA's best practice guidance, regulations and standards (CIfA, 2014b: 2014c).

2.7.1 Surveying and Setting Out

The original excavation area was set out by Jones Brothers Balfour Beatty Joint Venture (JBBBJV). The excavation area and all archaeological features were subsequently surveyed by ABA using a Leica Viva GPS system, all surveys were tied into the Ordnance Survey National Grid.

2.7.2 Excavation and Sampling

2.7.2.1 Mechanical Excavation

All mechanical excavation and stripping was undertaken by ABA. Topsoil and other overburden were removed using a tracked 360-degree excavator fitted with a toothless ditching bucket. Mechanical excavation proceeded to a depth sufficient to address the objectives of the excavation. Mechanical excavation ceased when the first archaeologically significant horizon was encountered or when the absence of any archaeological 'horizon' was adequately demonstrated. Spoil from the stripping operations was stockpiled in bunds outside of the archaeological excavation area. After the completion of mechanical excavation, both the spoil heaps and the stripped surface were scanned with a metal detector. Any artefacts of potential archaeological interest identified were recovered and their location accurately recorded (Horizon Nuclear Power, 2016; ABA, 2018).

2.7.2.2 Hand Excavation

After the removal of deposits overlying the archaeological horizon, the area was manually cleaned, and all features investigated and recorded. As pre-excavation plans of all visible features were prepared by GPS survey; this was printed out and brought to site to be checked and enhanced by hand planning. Unstratified artefacts or small finds exposed during the cleaning were collected. All hand cleaned surfaces, features and archaeological layers were scanned for metal object signals using a metal detector. Excavation priorities were assessed by taking these signals into account. All non-funerary type archaeological remains were excavated in accordance with the following strategy (ABA, 2018):

- Positive features likely to obscure earlier archaeological features 100%;
- Discrete negative features of less than 1m in diameter at least 50% by area in addition to all stratigraphic relationships;
- Discrete negative features of more than 1m in diameter at least 50% by area in addition to all stratigraphic relationships;
- Discrete negative features containing good artefact assemblages 100%;
- Non-structural linear negative features at least 10% by area in addition to all stratigraphic relationships and termini;
- Structural negative features 100% unless otherwise agreed with the Consultant;
- Hearths, pyre remains or other features with evidence of deliberate in situ heating 100%;
- All intersections between features, all terminals of linear features, and all other features 25% unless otherwise agreed with the Consultant; and
- The location of all small finds, except for those discovered within discrete features, were recorded in 3D by a GPS system tied into the OS NGR system, with an accuracy of \pm 5mm.

2.7.2.3 Recording

All excavated contexts were fully recorded in line with the standards set out in the WSI (Horizon Nuclear Power, 2016) using appropriate ABA pro-forma recording sheets:

• A complete drawn record of archaeological features and deposits was compiled - this includes both plans and sections, drawn to appropriate scales (1:20 for plans, 1:10 for sections). The

- Ordnance Datum (OD) height of all principal features and levels were calculated and plans/sections have been annotated with OD heights;
- All photogrammetry and drawing control points were located in 3D by a GPS system tied into the OS NGR system, with an accuracy of \pm 5mm; and
- The photographic record was compiled using digital cameras equipped with an image sensor
 of not less than 10 megapixels, these were taken as high-quality JPEG and RAW images, TIFF
 images will be created from RAW files for final archiving. Digital images were subject to
 managed quality control, curation processes which will embed appropriate metadata within
 the image and ensure long term accessibility of the image.

2.7.2.4 Paleoenvironmental Sampling

General environmental sampling was undertaken in accordance with Historic England's (2011) environmental archaeology guide in sampling methods for post-excavation analysis (ABA, 2018):

• Bulk environmental soil samples for plant macro fossils, small animal bones and other small artefacts were taken from appropriate well sealed and dated/datable archaeological contexts.

2.7.3 Archiving

The creation, compilation, transfer and deposition of the archaeological archive followed in line with the regulations of the Chartered Institute for Archaeologists Standards and Guidance (ClfA, 2014a; 2014b). At the time of writing the finds assemblage was under the curatorship of WA, and the digital and paper archive under the curatorship of ABA. Upon completion of the project the paper archive and all digital data including photographs will be lodged with the Royal Commission on Ancient and Historical Monuments of Wales (RCAHMW) in Aberystwyth. Digital copies of the report will be submitted to Horizon who will then distributed to stakeholders. Printed versions will only be produced if specifically requested. ABA will hold a digital version of the archive indefinitely.

3 Excavation Results

Excavation of Hotspot 8 (EVENT PRN 46041) revealed possible industrial and domestic activity in the form of a stone surface, ditches, the remains of a possible six post structure (*Figure 3*) and the recovery of furnace lining and a spindle whorl. The results of the excavation were first described in the ABA 2018 site summary report.

The results of the supplementary excavation areas, Hotspot 8B and Hotspot 15 West, opened to estimate the extent of the interaction between the archaeology in Hotspot 8 and the Romano British activity in Hotspot 15 are fully discussed in the Hotspot 15 report (ABA, 2021b) (EVENT PRN 46046). The Hotspot 8B extension was located to define the extent and nature of the probable field clearance (HER PRN GAT 91856) identified at the southern edge of Hotspot 8 and to determine whether the archaeology in Hotspots 8 and 15 were connected. The results of the Hotspot 8B excavation was used to inform the later excavation of Hotspot15 West.

3.1 Quantification of Excavation Data

Data Category	Number	
Context	55	
Small finds	2 (53.4g / 0.0534kg)	
Environmental samples	19 (310ltr / 31 buckets)	
Digital photographs	28 JPEG / 28 NEF	
GPS surveyed digital data	497KB	
Hand drawn sections	21	

Assigned PRNs

PRN	Feature
HER PRN GAT 91853	Stone Surface
HER PRN GAT 91855	Pits and Postholes
HER PRN GAT 91856	Field Clearance

3.2 Phasing/Stratigraphic Sequence

Post-excavation work involved checking and collating the site records, grouping contexts and phasing the stratigraphic data. A stratigraphic Harris Matrix was constructed from this data and is included as Appendix VII. A total of 55 contexts (*Appendix III*) were identified during the Hotspot 8 excavation. The physical relationship between features excavated at the site suggested four potential phases and/or groups of activity within the limits of Hotspot 8:

- 1. A stone surface;
- 2. Period 2 Ditches, possibly dating to the Neolithic and Early Bronze Age;
- 3. Period 3 Pits and postholes; and
- 4. Period 7 Post-medieval activity.

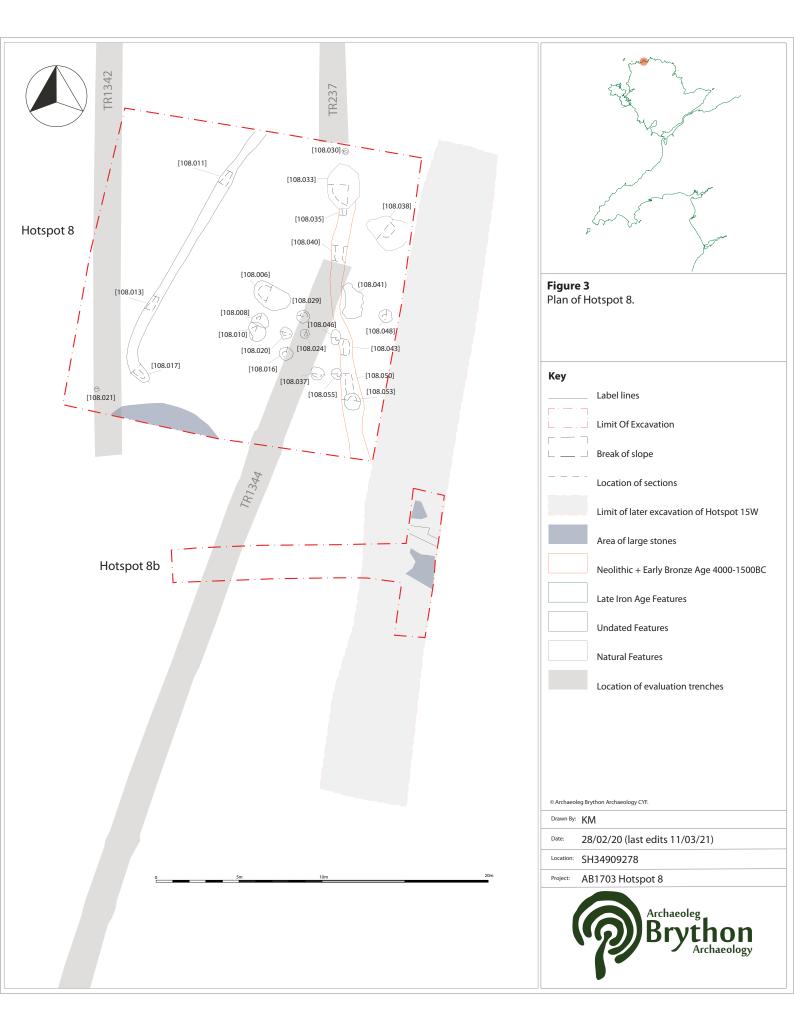

Period	Dates	
0 Natural		
1 Palaeolithic to Mesolithic	250 000 - 4000 BC	
2 Neolithic to Early Bronze Age	4000 - 1500 BC	
3 Late Bronze Age to Iron Age	1500 BC - AD 43	
4 Roman	AD 43 - 410	
5 Early Medieval	AD 410 - 1100	
6 Medieval	AD 1100 - 1539	
7 Post-medieval	AD 1539 - 1750	
8 Industrial and Modern	AD 1750 - present	
Undated		

3.2.1 Stone surface (HER PRN GAT 91853)

Upon stripping the topsoil and subsoil a consolidated deposit of blue schist slabs (108.0041) was encountered below the subsoil and above the natural glacial deposits. This deposit formed a possible stone surface measuring 2.0m in length, 1.5m wide and 0.10m thick (*Plate 1*). The surface was orientated north to south with the flat blue schist/slate stones placed closely together. The stones measured between 0.20m and 0.06m in length and were laid in a single course, no cut was observed. The stone surface was similar to the compacted stone surface (109.0210) identified in Hotspot 7-9, a Late Bronze Age to Iron Age burnt mount site with evidence of Neolithic, Iron Age, Romano-British and modern activity located 50m south west (ABA, 2021a).

Plate 1. Stone surface [108.0041]. View from the South, 1m Scale.

3.2.2 Period 2 - Ditches (HER PRN GAT 91854)

Two ditches were identified within the limits of Hotspot 8. The western ditch [108.0011] traversed the site on a north-east to south-west orientation. To the north it ran into the baulk beyond the excavation and at its southern end it turned south-east at a right angle towards its terminus. The ditch contained a mottled grey brown clay silt fill with frequent medium sub-angular stone inclusions. This ditch measured between 0.60m and 1.0m wide and between 0.16 and 0.26m deep. The ditch cut had a gradual break of slope with concave sides and a rounded base with a tapered rounded base at the terminus.

The eastern ditch [108.0035]=[108.0043] was orientated north–south, it measured between 0.43m and 0.84m wide and 0.2m deep (Plate 2). The cut of the ditch had gradually sloping sides and a concave to tapered rounded base. The fill of the ditch was a firm mid to dark grey brown silt clay with occasional subangular small to medium stone inclusions. A fragment of possible furnace lining was recovered from the fill of the ditch. The ditch was cut by three pits [108.0046], [108.0055] and [108.053] and a tree throw [108.0033]. This ditch may be related to ditch [215.0024] excavated in Hotspot 15 West, located to the east. Radiocarbon dating of charcoal recovered from ditch fill (108.0049) returned a Neolithic date of c. 4001-3936 BC, and the fill of pit [108.0053] a Late Iron Age date of c. 336-186 BC. However, the material dated is likely to be part of the backfill of these features and not the result of *in situ* burning (Appendix V).

Plate 2. Section of ditch [108.0043]. View from the North, 0.3m Scale.

3.2.3 Period 3 - Pits and Postholes (HER PRN GAT 91855)

Pits [108.0046], [108.0053] and [108.0055] were part of a group of 12 pits located in the south-east corner of the Hotspot. The positioning of the pits may be suggestive of a structure and may relate to the Romano-British activity identified in Hotspot 15 to the east. Of the 12 pits, pit [108.0006] was the largest measuring 1.45m in diameter (*Plate 3*). The relationship between pits [108.0008] and [108.0010] could not be determined as the fills of each were very similar. These three pits were situated at the west end of the possible structure.

The majority of the 12 pits contained fills of compact mid to dark brown grey to brown silt clay, suggesting they were contemporary, with four exceptions. Pit [108.0046] was observed to contain compact dark grey brown sandy silt, and pit [108.0012] contained loose mid grey silt clay. Pits [108.0020] and [108.0016] both contained two fills of similar composition, the lower deposit of each was a compact mid brown black silt clay, overlain by a compact mid brown silt clay. The pits varied in diameter from 0.5m to 1.0m and between 0.12m and 0.3m in depth. The depth might suggest the features had been heavily truncated.

The remains of two small post-holes were positioned near the termini of the two ditches and were possibly related to them. Post-hole [108.0030] was located to the north of the terminus of ditch [108.0035], it was circular in plan with a flat base and measured 0.39m in diameter and 0.05m in depth (*Plate 4*). Its fill (108.0034) consisted of a loose grey brown sand with a charcoal deposit around the edge. Posthole [108.0021] was located by ditch [108.0011] terminus and was circular in plan with a flat base, measuring 0.20m in diameter and 0.04m in depth (*Figures 4 to 6*). The fill (108.0022) consisted of loose light grey brown sand with a charcoal ring around the edge.

The remains of two tree-throws, [108.0033] and [108.0038], were also observed within the boundary of Hotspot 8 (*Plate 5*). The largest of these tree-throws, [108.0033] measured up to 2.55m in diameter and was filled with a mid-grey brown silt sand deposit which contained evidence of root disturbance. No datable finds relating to the tree-throws were recovered.

Plate 3. Section of pit [108.0006]. View from the West, 1m Scale.

Plate 4. Section of post-hole [108.0030]. View from the South, 0.2m Scale

Plate 5. Section of tree-throw [108.0038]. View from the East, 1m Scale.

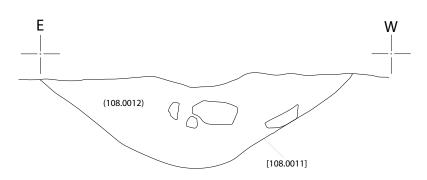

Figure 4. Northern section through ditch [108.0011].

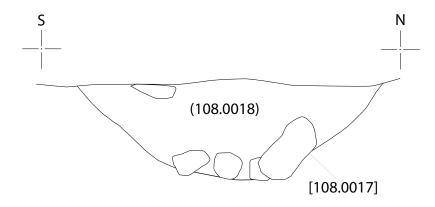

Figure 5. Southern section across ditch [108.0017] (same feature as [108.0011])

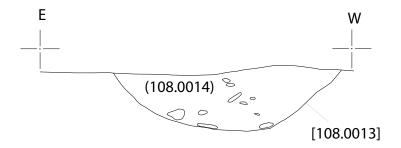

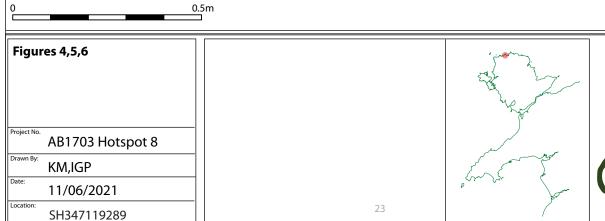

Figure 6. Section through terminus of ditch [108.0013] (same feature as [108.0011])

3.2.4 Period 8 - Modern activity - Field clearance (HER PRN GAT 91856)

In the south-west corner of the Hotspot 8, evidence of modern field clearance activity was identified in the form of large stones within the subsoil, some of these stones measured more than 0.5m across (*Plate 6*). It is likely that these were moved due to post-medieval agricultural activity, possibly during the digging of the current drainage ditch and field boundary which runs north to south approximately 3m to the west of this excavation. Given the nature of the archaeology in Hotspot 15 and Hotspot 15 West it is probable that these stones came from some similar, possibly related, stone-built features nearby.

Plate 6. Modern field clearance activity. View from the North, 1m Scale.

4 Assessment of Potential and Significance

All finds were treated in accordance with the guidelines set out in Watkinson and Neal's (1998) and ClfA's (2014a; 2014b) standards and guidelines in collecting, packaging and documenting of archaeological materials. The finds assemblage and environmental samples were handed over to WA in April 2019 for curation and assessment of potential. All processing of artefact and ecofacts were undertaken away from site. At the time of writing the finds assemblage was under the curatorship of WA.

4.1 Finds Assessment

During the excavation of Hotspot 8 two small finds (SF), with a combined weight of 51g, were recovered. The finds assessment was compiled by Sue Thompson, and the full Finds Assessment Report is included as Appendix IV.

4.1.1 Stone

A singe flat circular spindle whorl, SF002 (31g), was recovered from topsoil context (108.0001). The artefact was in good condition and manufactured from a fine red sandstone, and was 40mm in diameter, 9mm thick with a central hole of 11mm. Spindle whorls date from the Iron Age to medieval period. The spindle whorl should be considered along with similar objects from neighbouring sites for further analysis.

4.1.2 Fired Clay

A single fragment of fired clay, SF001 (20g), was recovered from the fill of ditch [108.0035]. The fragment was in moderate condition, highly fired and oxidised to a brick red exterior with extensive internal vitrification. The fragment closely matches furnace lining material recovered from the Wylfa Head site located to the north east.

An additional 22g of possible fired clay fragments were recovered from eight environmental samples. The fragments were small and highly abraded. Further analysis may be warranted on the fired clay and it should be considered with similar material from neighbouring sites.

4.1.3 Industrial waste

A total weight of 170g fragments of industrial waste was recovered from 17 samples and consist of small pieces of possible slag. No further analysis was recommended.

4.2 Palaeoenvironmental Assessment

A total of 19 bulk environmental samples were taken during the excavation of Hotspot 8. Eighteen bulk samples, weighing 302kg were processed by WA. Samples were processed according to guidelines stipulated in the Wardell Armstrong LLP. Technical Manual No. 2 (2018) and Wardell Armstrong (2019) (*Appendix V*). Due to samples being damaged in storage and transit, one sample was deemed unfit for processing by WA. The assessment identified the significance and potential of the material for further analysis, and provided identification to species where practical to do so

on material selected for radiocarbon dating. The full report by Freddie Sisson is included as Appendix V. No charred plant remains (CPR), bone or shell material was recovered from the environmental samples.

4.2.1 Results

Overall, the samples were dominated by silt sand sediment matrix. Artefactual material recovered from the dried residues was minimal and include pieces of ceramic building material (CBM) and industrial waste. The material recovered from the flots are outlined below. The paucity of palaeoenvironmental material from this site is relative to the whole of the Wylfa complex with some exceptions. This is likely to have been the result of taphonomic issues rather than the absence in the past.

4.2.1.1 Charcoal

Fourteen samples yielded charcoal remains which were in a relatively good state of preservation. Six of these yielded remains of 5g or more: sample <5> from fill (108.0015) of pit [108.0016] and sample <6> from fill (108.0025) of pit [108.0016]; sample <7> from fill (108.0019) of pit [108.0020], sample <11> from fill (108.0031) of posthole [108.0030]; sample <13> from fill (108.0028) of pit [108.0029]; and sample <15> from fill (108.0023) of pit [108.0024].

Since the charcoal all came from fills of pits, ditches and postholes it is likely to be part of the backfill of these features and not the result of *in situ* burning. However, the charcoal from <11> taken from posthole [108.0030] may be left over from *in situ* burning of the post within the posthole and when put into a wider context may help to inform about the types of wood preferred for different structures. With charcoal present in fourteen of the eighteen samples further analysis may inform which species were being favoured for fuel and other industrial activities. Focus could be given to <11> as it could be remains of the original post from the posthole [108.0030] and help inform on preferred species for construction. Further analytical work should be undertaken on charcoal from <5>, <7>, <13> and <15> which would allow for an insight into past wood and fuel procurement practices.

4.2.1.2 Magnetic Material

The magnetised material recovered from the dried retents consisted of a mix of small stones and fragments of industrial waste in the form of slag. The magnetised matter from all samples should be retained and analysed in conjunction with any further work on the industrial waste if this occurs, as long as the assemblage is large enough.

4.3 Radiocarbon Dating Results

Samples for radiocarbon dating were selected based on the archaeology of the site, i.e. selecting viable contexts that would yield useful information, and the results obtained from bulk environmental sample assessment, i.e. selecting suitable material for dating from the samples obtained from the selected contexts. Based on this criteria three samples were suggested for radiocarbon dating, of which two were successfully analysed. The samples were sent to Beta Analytic Radiocarbon Dating Laboratory for analysis. Prior to dating, it was suggested that the

charcoal samples were identified to species to select the shorter-lived species to mitigate against the potential 'old wood effect' that may present a radiocarbon date range older than the feature. In the absence of single growth entities such as charred plant remains and hazel nutshell fragments, charcoal was chosen for radiocarbon determinations. Where no short-lived species were observed the youngest i.e. twig, branch or periderm fragments from longer-lived species such as oak were selected (*Appendix V*). The results are presented in Appendix VI, and summarised below:

Sample	Context	Material	Date (probability %)	Period
18	108.0049 - fill of ditch	Indeterminate	4001-3936 cal BC (74%)	Neolithic
19	108.0052 – fill of pit	Willow / Poplar	366-186 cal BC (95.4%)	Late Iron Age

5 Discussion and Statement of Potential

Hotspot 8 was targeted for excavation because of the potential for archaeology identified during evaluation trenching which revealed four pits. Due to the small number of datable features and archaeological material identified during the excavation of Hotspot 8, the information gained from the assessment is limited. However, the excavation and assessment has revealed a site which has archaeological potential that requires further analysis to properly understand the archaeological features identified and how they relate to their wider setting.

A number of features comprising 12 pits which may have accommodated posts, two post-holes, two ditches and a stone surface were identified and excavated during the course of the excavations at Hotspot 8.

The earliest features at the site are likely to be the ditches, although only the eastern ditch [108.0035]=[108.0043] was dated and this was also the only ditch which could also be shown to be stratigraphically earlier. The eastern ditch was dated to the Neolithic which suggests that they are not associated with the later activity identified to the east in Hotspot 15 but could be associated with, or are broadly contemporary with, activity identified in Hotspot 11-13 and Area 7. It must however be stressed that the single date with no contemporary artefacts and the discovery of vitrified fired clay, which would be unusual from a Neolithic context, from the same deposit may suggest that the early date is due to intrusive material.

The later activity consisted of the erection of a rectangular structure as evidenced by the surviving pits which may have accommodated posts. The function of this building is unclear at present, but the arrangement of the posts would be consistent with other structures, such as those at Cefn Du, Gaerwen (HER PRN GAT 62570) (Cuttler *et al*, 2012), Hotspot 15 (HER PRN GAT 91870/91872), Wylfa Head (HER PRN GAT 91816) and within the partially enclosed settlement at Area 7 (HER PRN GAT 91829), which have been interpreted as granaries. Radiocarbon dating of pit [108.0053] suggests a Late Iron Age date for the structure which would correlate with the interpretation. The lack of charred plant remains in general from Hotspot 8 could weaken this interpretation, however this may be due to ground conditions not being favourable to their preservation. Although the stone surface (108.0041) could not be stratigraphically dated it could be interpreted as a small thrashing surface associated with the granary but the lack of plant remains recovered may weaken this interpretation.

The recovery of a fragment of probable furnace lining from the fill of the eastern ditch and the identification of micro slags from a number of samples indicates local industrial activity and the spindle whorl from the topsoil also suggest domestic activity. The settlement identified in Hotspot 15 revealed evidence of both domestic and industrial activity which is typical of sites of this period, likely implying a largely self-sufficient existence with small scale industrial processes taking place alongside domestic activities. It would not be unreasonable to assume that all the Iron Age and later activity identified in Hotspot 8 is directly related to the settlement identified in Hotspot 15, and is likely related to the later activity identified in Hotspot 7-9.

Determining a definite chronology for archaeological remains recorded at Hotspot 8 from the feature typology, lack of stratified finds is currently problematic but should be achievable with further radiocarbon dating.

The archaeology identified in Hotspot 8 and other nearby excavations demonstrates that the area in general has high archaeological potential. The similarity in the archaeology identified in Hotspot 8, Hotspot 15, Hotspot 7-9, and all subsequent extensions, suggests the presence of related settlement activity across a wide area. It is likely that areas which have not been fully excavated have significant archaeological potential.

5.1 Conclusion and Realisation of Original Aims and Objectives

The original aims and objectives stated in section 2.6 has largely been met in that material was recovered during the Hotspot 8 excavation in order to date evidence of past activities, and samples were taken to better understand the past environment and land use. During the excavation the remains of 12 pits, two postholes, two ditches and a stone surface was revealed. The recovery of furnace lining from a ditch indicated possible industrial activity. Domestic activity was identified via the recovery of a spindle whorl, and a possibly granary (interpreted from pits and postholes). It was suggested that the features may relate to the edge of settlement activity associated with Romano-British archaeology identified in Hotspot 15, Hotspot 15 West and Hotspot 8B to the east, and the stone surface identified in Hotspot 7-9 to the south.

To fulfil the potential of the site data the updated objectives and research questions have been set out below to provide a framework for the proposed further analysis. Addressing the aims and objectives will be achieved through a detailed examination of the stratigraphy and contextual analysis of the finds, and comparative study of similar finds and features identified at nearby sites. *Prehistoric;*

- 1. Are the possible structural features associated with isolated structures or part of a larger settlement?
- 2. What relationships or patterns, if any, can been seen between these Prehistoric features and their wider landscape setting?
- 3. What evidence do the ditch features provide for Prehistoric landscape organisation and enclosure?
- 4. What relationships or patterns, if any, can been seen between these potential Prehistoric features and their wider landscape setting?
- 5. What types of artefacts are present in the SMS zones?
- 6. What can these artefacts tell us about daily life and ritual activity?
- 7. Were those artefacts, which may be found in the SMS Zones, produced locally?

Post-Medieval;

- 1. What can the ditches and land drains tell us about the process of enclosure and land
- 2. improvement in the Post-Medieval to the Modern periods in the SMS zones?
- 3. What evidence is there for the types of farming and land use in this area in the Post-Medieval and Modern periods in the SMS zones?

Due to the proximity of the Romano-British activity identified in Hotspot 15, Hotspot 15 West and Hotspot 8b located to the east, the following questions may also be relevant:

Romano-British;

- 1. How did the culture on the island change, and in what ways, between the Roman and early medieval periods?
- 2. What types of Roman Sites are present with the Wylfa Newydd Development Area, and how do they relate to their surrounding landscape both in terms of location and utilisation of the landscape?

6 Proposal for Further Work

The results from the investigation are of local and regional interest and should be considered along with similar findings from neighbouring archaeological areas. It is proposed that a detailed site report, incorporating stratigraphic and further specialist finds analysis as recommended by the specialist assessment reports (*Appendix IV and V*) are produced.

- Fired Clay Further analysis may be warranted and it should be considered with similar material from neighbouring sites.
- Stone The spindle whorl should be considered along with similar objects from neighbouring sites for further analysis.
- Charcoal Further analytical work should be undertaken on charcoal from sample <5>, <7>,</11>, <13> and <15> which would allow for an insight into past wood and fuel procurement practices.
- Magnetic Material Magnetised matter from all samples should be retained and analysed in conjunction with any further work on the industrial waste.

7 Storage and Archive Deposition

At the time of writing the paper and digital archive was held at the ABA offices in Bangor, Gwynedd. The finds assemblage and environmental samples was under the curatorship of WA. Upon completion of the project, and with agreement with HNP and the relevant stakeholders, the paper archive and digital data, including photographs will be lodged with the Royal Commission on Ancient and Historical Monuments of Wales (RCAHMW) in Aberystwyth, under an accession number yet to be assigned. ABA will hold a digital version of the archive indefinitely.

Appendix II

AB1703 Wylfa Newydd Early Clearance Works Site Gazetteer

Wylfa Head 91809 Lithic Scatter 235752 393877 Early Neolithic Flint scatters consisting of a number of flint tools and debitage recovered from standard (10.1954) that had evidence of being heat affected Two large pits [10.01372] and [10.1994] located in the north-western corner of six were sub-circular in plan and possibly contemporary. Pit [10.1994] contained fire stone (10.1964) and the remains of a burring episode (10.1996) Lithic scatters identified in test slot [10.2725] dug through two palaeosols (10.26) (10.2790). The assemblage was indicative of Mesolithic activity and included class forms and bladelets. Radiocarbon dating of spit (10.19730) returned a Late Neolith (10.2790). The assemblage was indicative of Mesolithic activity and included class forms and bladelets. Radiocarbon dating of spit (10.19730) returned a Late Neolith (10.2790). The assemblage was indicative of Mesolithic activity and included class forms and bladelets. Radiocarbon dating of spit (10.19730) returned a Late Neolith (10.2790). The assemblage was indicative of Mesolithic activity and included class forms and bladelets. Radiocarbon dating of spit (10.19730) returned a Late Neolith (10.2790). 						of gully [109.0132]; north-east to south-west aligned ditch [109.0198] that cut pit [109.0204] and ditch [109.0207]; northeast to southwest aligned ditch [109.0207]; and pit [109.0205]. No dating evidence was recovered
Hotspot 7-9	91849	Ditch	234863	392763	Undetermined date	North-East to South-West aligned ditch [109.0008] located at northern end of site. It continuing beyond limit of excavation and terminated north of the bedrock outcrop (HER PRN GAT 91850).
Hotspot 7-9	91850	Possible Quarrying	234860	392751	Undetermined date	Possible tool marks identified on outcrop of schist. Possible quarrying location for nearby settlement and long-cist cemeteries.
Hotspot 7-9	91851	Trackway	234864	392737	Undetermined date	Short section of trackway (109.0085) running from the north-east to the south-west (continued beyond limit of excavation). May be the same as (HER PRN GAT 91843) located to the southwest.
Hotspot 7-9	91852	Pits	234865	392765	Undetermined date	A number of undated pits of no apparent function identified in Hotspot 7-9.
Hotspot 8	91853	Stone Surface	234912	392781	Undetermined date/Likely Romano British	A surface of laid schist slabs, orientated North-South measuring approximately 2m x 1.5m. Likely associated with Romano British features in the vicinity.
Hotspot 8	91854	Ditches	234907	392786	Undetermined/Neolithic	Two ditches identified in Hotspot 8. Ditch [108.0035]=[108.043] was orientated North-South at the eastern side of the excavation area, it produced a Neolithic date and was cut by Late Iron Age features. The western ditch [108.0011] was orientated north-east to south-west and was undated.
Hotspot 8	91855	Pits and Postholes	234908	392780	Late Iron Age	A number of pits and postholes located at the south-eastern quarter of Hotspot 8. Likely to represent truncated postholes forming a structure, possibly a granary. Late Iron Age date obtained from pit [108.0053].
Hotspot 8	91856	Filed Clearance	234901	392774	Undetermined date	A deposit of stones, likely representing field clearance identified at the southern limit of excavation.
Hotspot 10	91857	Pit	234933	392962	Late Neolithic Early Bronze Age	A discrete pit [110.017] which was radiocarbon dated to the Late Neolithic or Early Bronze Age, 1.3m in diameter and 0.45m deep.
Hotspot 10	91858	Ditches	234938	392956	Undetermined date	A series of four ditched identified within the excavation area. The earliest by stratigraphy were a pair of parallel ditches [110.008] & [110.014] at the southern edge of the area which were orientated east-west. These were cut by a narrower ditch [110.007] orientated approximately north-south. Ditch [110.026]=[110.028], which was orientated north-east to south-west was 5m in length, terminated 0.5m north of ditch [110.020] and ran into the western baulk. The nature of the ditches suggests that they relate to a relict field systems.
Hotspot 11-13	91859	Pits, Stakeholes, Postholes and Stone Bank	234958	392894	Neolithic	A number of prehistoric features including a stone bank (113.0186), two pit groups and stone lined furnace or oven [113.0136] with associated stakeholes at the western side of the excavation area.
Hotspot 11-13	91860	Enclosure	234977	392902	Undetermined date	An apparent square or rectangular enclosure with an entrance orientated to the south-east was excavated at the north of the Hotspot. Stratigraphically pre-dated the early medieval features.
Hotspot 11-13	91861	Ditch	234969	392895	Undetermined date	Ditch [113.0032] pre dated the early medieval features and cut enclosure (HER PRN GAT 91860). The ditch traversed the entire excavation area on a north-west to south-east orientation.

Appendix IV

AB1703 Wylfa Newydd Early Clearance Works Hotspot 8 Finds Assessment

Appendix IV. Hotspot 8 Finds Assessment Report

HOTSPOT 8 FINDS ASSESSMENT

Introduction

A total of two artefacts, weighing 51g, were recovered from an archaeological investigation on Hotspot 8. Both artefacts were assigned small find numbers on site.

All finds were dealt with according to the recommendations made by Watkinson & Neal (1998) and to the Chartered Institute for Archaeologists (CIfA) Standard & Guidance for the collection, documentation, conservation and research of archaeological materials (CIfA 2014b). All artefacts have been boxed according to material type and conforming to the deposition guidelines recommended by Brown (2011), EAC (2014) and The Oriel Museum. The project has the unique identifier WA 2019 / CL12283/ AB1703.

The material archive has been assessed for its local, regional and national potential in line with the archaeological research framework for Wales (https://www.archaeoleg.org.uk/areanorthwest.html).

The finds assessment was compiled by Sue Thompson.

Quantification of finds by material and context is given in Table 1; quantification of finds recovered from the environmental samples is given in Table 2.

Area	Context	Small Find	Material	Qty	Wgt (g)	Period	Comments
HS-8	108.0034	1	Fired Clay	1	20	Prehistoric - Med	Hard fired, coarse
HS-8	108.001	2	Stone	1	31	Prehistoric - Med	Spindle whorl. Fine red sandstone
Total				2	51		

Table 1: Quantification of Finds by Material and Context

Fired Clay

A single fragment of fired clay, **SF1**, was recovered from context (**108.0034**). It weighs 20g and is in moderate condition.

The fragment is highly fired and oxidised to a brick red externally with extensive vitrification internally. This fragment closely matches furnace lining material recovered from Wylfa Head

cemetery site. Further analysis may be warranted on the fired clay and it should be considered with similar material from neighbouring sites.

Stone

A single stone artefact, **SF2**, weighing 31g, was recovered from context (**108.001**).

The artefact was in good condition and comprised a flat circular spindle whorl manufactured using fine red sandstone. The spindle whorl was 40mm diameter and 9mm thick with a central hole measuring 11mm.

It is difficult to accurately date spindle whorls because they remained in use with little change over a long period. The Portable Antiquities Scheme (PAS online 2020) records examples dating from the Iron Age to the post-medieval period. https://finds.org.uk/counties/findsrecordingguides/spindle-whorls/. That said, spindle whorls with larger holes may be of later date and may be of late Anglo-Saxon to medieval date (Rogers 1997).

Essentially, spindle whorls were used for spinning yarn and the manufacture of textile production. The whorl is often a disc shaped object and were a means of weighting the spindle or stick. Because the spindle was usually made of wood, they are less likely to survive than the spindle whorls, which were commonly made with stone, lead and bone and fired clay.

The spindle whorl should be considered along with similar objects from neighbouring sites for further analysis.

Finds from Environmental Samples

Context	Sample	Fired Clay(g)	Industrial Waste(g)
108.0004	1		8
108.0005	2		137
108.0025	6	<1	6
108.0026	8	1	
108.0039	9	9	8
108.0018	10	<1	10
108.0031	11	<1	<1
108.0028	13	<1	
108.0036	14		<1

108.0047	16	12	
108.0032	17	<1	

Table 2: Finds recovered from Environmental Samples

Fired Clay: A total weight of around 22g of possible fired clay fragments were recovered from eight environmental samples. The fragments were very small and highly abraded.

Industrial Waste: A total weight of 170g fragments were recovered from seven samples. The fragments represent small pieces of possible slag. The fragments are small and undiagnostic.

Recommendations. While they need to be considered alongside the bulk finds assemblage, a separate data set is appropriate for the finds from environmental samples, as it represents a separate recovery and quantification strategy for the retrieval of finds.

No further analysis is required for the fired clay fragments. Further analysis of the industrial waste may be warranted as part of the wider project.

Statement of Potential

Although spindle whorls are not uncommon finds on archaeological excavations, the wider archaeological works at Wylfa recovered a significant number of similar artefacts and other items related to textile production. The fired clay is of note; however, a single fragment is of low archaeological importance.

No closely datable artefacts were recovered from Hot Spot 8. The finds should be considered with those recovered from neighbouring sites rather than being seen in isolation.

Appendix V

AB1703 Wylfa Newydd Early Clearance Works Hotspot 8 Palaeoenvironmental Assessment

Appendix V. AB1703 Hotspot 8 Palaeoenvironmental Assessment

Palaeoenvironmental assessment

1.1 Introduction

- 1.1.1 Eighteen bulk samples were taken during the excavation on Hotspot 8 at Wylfa Newydd Nuclear Power Plant located in Anglesey, North Wales. A total weight of 302kg (233l) of sediment was processed for this stage of works. Further details for each sample can be found in Table 1.
- 1.1.2 This environmental assessment was undertaken by Freddie Sisson.

1.2 Methodology

- 1.2.1 This report presents the results of the assessment of the environmental samples, palaeobotanical and charcoal remains in accordance with Campbell et al. (2011) and English Heritage (2008). The assessment will establish the significance of the material and will only provide identifications where it was practicable to do so, such as, small quantities of plant material or charcoal identifications where radiocarbon determinations are sought. The report will focus on the preservational qualities and note the potential of the material to warrant analysis.
- 1.2.2 The bulk environmental samples were processed at Wardell Armstrong LLP following methodologies detailed in Wardell Armstrong (2018 and 2019). The colour, lithology, weight and volume of each sample was recorded using standard Wardell Armstrong pro forma recording sheets. cf. Table 1. The samples were processed with 500-micron retention and flotation meshes using the Siraf method of flotation (Williams 1973). Once dried, the residues from the retention mesh were sieved to 4mm and the artefacts and ecofacts removed from the larger fraction and forwarded to the finds department. The smaller fraction was scanned with a magnet for microslags such as hammerscales. This fraction was then examined for smaller artefacts such as beads. Once fully sorted, and all relevant material removed, the retent residues were discarded.
- 1.2.3 The flot plant macrofossils and charcoal were retained and scanned using a stereo microscope (up to x45 magnification). Any non-palaeobotanical finds were noted on the flot pro forma, cf. Table 2. Once fully sorted and all relevant material removed the flots were discarded.
- 1.2.4 The four common palaeoenvironmental materials (namely plant remains, charcoal, shell and bone), along with magnetic matter, will be listed within the results section and where none were present this will be stated.
- 1.2.5 In the absence of single growth entities such as charred plant remains and hazel nutshell fragments charcoal will be utilised for radiocarbon determinations. Charcoal was only identified to species to select the shortest-lived species for radiocarbon determination once the report author had determined what they would like dated. Where no short-lived species were observed the youngest i.e. twig, branch or periderm fragments from longer-lived species were selected. Once this was achieved no further identification was undertaken. Identification was undertaken using Hather (2000), Schweingruber (1982) and the author's own reference collection. Nomenclature followed Stace (2010).

1.3 Results

- 1.3.1 The sediment matrix was a predominantly silty sand with lesser amounts silt, sand and clay mixes, further data can be observed in Table 1.
- 1.3.2 Flot and finds data is presented in Table 2.
- 1.3.3 Artefactual material recovered from the dried residues were minimal but contained examples of ceramic building material and industrial waste.
- 1.3.4 CPR: No charred plant remains (CPR) were recovered at Hotspot 8.
- 1.3.5 CHARCOAL: Fourteen samples yielded charcoal remains which were in a relatively good state of preservation. Six of these yielded remains of 5g or more, these were: sample <5> from fill (108.0015) of pit [108.0016], sample <6> from fill (108.0025) of pit [108.0016], sample <7> from fill (108.0019) from pit [108.0020], sample <11> from fill (108.0031) of posthole [108.0030], sample <13> from fill (108.0028) of pit [108.0029], and sample <15> from fill (108.0023) of pit [108.0024].
- 1.3.6 For the purposes of charcoal identification for radiocarbon determination (see 1.2.5 for expansion) willow/poplar (*Salix/Populus*) was identified within sample <19> from fill (108.0052) of pit [108.0053].
- 1.3.7 SHELL: No shell was recovered from Hotspot 8.
- 1.3.8 BONE: No bone was recovered in the samples from Hotspot 8.
- 1.3.9 MAGNETIC MATTER: Magnetic material was recovered from all the samples and was made up of a mix of small stones and small fragments of industrial waste in the form of slag. Further discussion on industrial waste is in the finds section of this report.

1.4 Discussion

- 1.4.1 Since the charcoal all came from fills of pits, ditches and postholes it is likely to be part of the backfill of these features and not the result of *in situ* burning. However, the charcoal from <11> taken from posthole [108.0030] may be left over from the *in situ* burning of the post within the posthole and when put into a wider context may help to inform about the types of wood preferred for different structures.
- 1.4.2 The paucity of other palaeoenvironmental material from this site is relative to the whole of the Wylfa complex with some exceptions. This is likely to have been the result of taphonomic issues rather than the absence in the past.

1.5 Statement of potential and recommendations

- 1.5.1 With charcoal present in fourteen of the eighteen samples further analysis may inform which species were being favoured for fuel and other industrial activities. Focus could be given to <11> as it could be remains of the original post from the posthole [108.0030] and help inform on preferred species for construction. Further analytical work should be undertaken on charcoal from <5>, <7>, <13> and <15> which would allow for an insight into past wood and fuel procurement practices.
- 1.5.2 If the charcoal assemblages continue into analysis then the contexts which they originate should be dated prior to this work; either by typologically or absolute means.

- 1.5.3 *Radiocarbon suitability*: The most suitable samples for obtaining radiocarbon suitability is the charcoal from <5>, <7>, <11>, <13>, and <15>.
- 1.5.4 It must be stated that if a radiocarbon determination is sought from charcoal then the fragment must be identified to species prior to submission to select the shorter lived species to mitigate against the potential 'old wood effect' that may present a radiocarbon age far older than the feature.
- 1.5.5 *Retention and discard*: At this stage all ecofactual material should be retained until initial radiocarbon dates have been obtained and further analysis has been undertaken.
- 1.5.6 The magnetised matter from all samples should also be retained and analysed in conjunction with any further work on the industrial waste if this occurs, as long as the assemblage is large enough.

1.6 Acknowledgments

1.6.1 Freddie Sisson supervised the environmental team who consisted of, Megan Lowrie, Katherine Bostock, Jyoti Stuart and Sean Johnson. This report was edited by Lynne F. Gardiner.

WYLFA NEWYDD POST EXCAVATION ASSESSMENT METHODOLOGY

Introduction

This document has been prepared to provide the client with an explanation of the Post Excavation Assessment (PXA) process and to provide Wardell Armstrong's own technical team, with clear guidance on undertaking the PXA for the Wylfa Newydd archaeological mitigation works. Post Excavation Assessment (PXA) is the first stage of a process of post-excavation analysis, publication and archive deposition. It provides quantification and initial assessment of the archive resulting from excavation and provides a framework to inform further investigation and publication. It is designed to ensure that Horizon Nuclear Power meet their requirements to secure discharge (by the two primary stakeholders: Gwynedd Archaeological Planning Service (GAPS) and CADW) of the early works archaeological mitigation programme at Wylfa Newydd.

It is based on the requirement described in the Written Scheme of Investigation for Trial Trenching and Excavation (2015) and Written Scheme of Investigation for Strip Map and Sample Excavation and Paleoenvironmental Assessment (2016). It is informed by the following guidance, Association of Local Government Archaeological Officers (ALGAO) Advice Note for Post-Excavation Assessment (2015), Conservation principles for the sustainable management of the historic environment in Wales CADW (2011), Chartered Institute for Archaeologists (CIfA) Standard and Guidance for Archaeological Excavation (2014) sections 3.4 to 3.6, and for human remains The British Association of Biological Anthropology and Osteoarchaeology Human Bones from Archaeological Sites. In addition, GAPS require reference to Society of Museum Archaeologists (1993), Selection, Retention and Dispersal of Archaeological Collections: Guidelines for use in England, Wales and Northern Ireland, as well as Welsh Office Circular 60/96, (1996), Planning and Historic Environment: archaeology. This current document identifies the stages of the PXA process, then describes the broad tasks

This current document identifies the stages of the PXA process, then describes the broad tasks required for each stage. The document concludes with a report template containing individual sections within the PXA report and UPD.

Requirement for and Purpose of the Post Excavation Assessment

The PXA will follow a staged process of post excavation assessment detailed in Written Scheme of Investigation for Trial Trenching and Excavation (2015) and the Written Scheme of Investigation for Strip Map and Sample Excavation and Paleoenvironmental Assessment (2016).

As stated in the ALGAO *Advice Note for Post-Excavation Assessment*, "following the completion of archaeological fieldwork, it is standard practice for a post excavation assessment (PXA) to be undertaken". CIfA describe the purpose of a PXA as a means by which "the findings should be assessed against the original project design to determine the extent to which the original research aims have been met, and the identification of any new research questions to be incorporated in a post-excavation project design". CIfA further state that PXA work "must be carried out by suitably qualified and experienced staff, who must be apprised of the project design before commencing work. The post excavation manager should preferably be a corporate member of CIfA. The level of assessment of records and materials should be appropriate to the aims and purpose of the project".

In brief the PXA process involves cleaning, processing, sorting and cataloguing the finds and environmental samples and the ordering of the documentary site records to create an archive, and then assessment of that archive to focus further analysis and reporting on that archive. The archive consists of two elements, the material archive (finds, processed environmental samples and human remains) and the documentary archive (site records and ancillary research documentation such as notes on archival sources).

Post Excavation Assessment Stages and Outputs

The PXA consists of four separate, largely, though not necessarily, sequential stages; processing of the finds, palaeoenvironmental samples and any human remains (the material archive); archival preparation for data assessment and deposition (both material and documentary archive); data assessment and finally reporting. The outputs are two stand alone documents, although often bound together under a single cover as they will be in this case. The documents are the Data Assessment Report (DAR) which quantifies the data, identifies its significance and potential for further research, and the Updated Project Design (UPD), which scopes the response necessary by achieving the site's research potential and provides the basis for a cost for doing so.

The proposed work described in the UPD is entirely separate from the PXA and will form a future stage of work involving any necessary post-excavation research and leading to the

publication of the results of the excavation. This future stage concludes with the deposition of the entire project archive with the Oriel Museum Anglesey. Funding of the required future research, publication and archive deposition for long-term curation is a requirement to secure final discharge of the 2017-2019 phase of fieldwork at the Wylfa site.

For Wylfa Newydd each site will have a separate DAR and UPD to allow GAPS/CADW and the client, to be fully appraised of the justifications for further analytical work. Each site can then be discussed in relation to its specific significance before arriving at a consensus with regard to further work requirements. There will also be a need for an overview DAR and UPD which will have two functions:

- To succinctly summarise the findings of the individual site DARs and UPDs following consultation and provide a cohesive assessment of the whole project as well as a basis for an overall justified costing for future work requirements.
- To provide a research statement regarding the overall potential of the Wylfa
 Newydd development area. Clearly many of the sites will not merit the publication of
 a standalone report. Consequently, the research potential of such sites will be best
 realised in contributing to period-based volumes that address regional research
 framework questions.

Stage 1 Processing

A summary of the processing requirements is given below. A more detailed breakdown of the required procedures for finds is contained in appendix 1 and for environmental samples in appendix 2.

Environmental sample processing involves sieving individual 10 litre tubs of soil samples for bulk samples (collected from site) in a purpose-built water filtration tank. The flots (floats) and retents (sinks) are then dried, bagged and labelled. More specialised forms of sample processing may be required for other samples taken such as column samples for insects, pollen monoliths or cores, but these represent only a tiny fraction of the samples collected. Human remains (cremated and non-cremated) require different cleaning methods depending on their state of preservation. Non-cremated articulated and disarticulated human remains in good condition will undergo wet cleaning but without the bones being immersed in water. Human remains in poor condition must not be wet-washed and will have to be dry-brushed to avoid unnecessary damage to the remains.

Bulk finds are cleaned by washing. Small finds are cleaned according to the requirements of the material, this usually but not always involves washing. Following cleaning, most finds will need to be dried and some may require stabilisation to preserve them. Cleaning and stabilisation by material and object will be as described in Watkinson & Neal (1998). Specialist conservation will not be routinely undertaken at this stage as this will involve items being sent away to specialist laboratories and the consequent costs, but the conservation need will be defined by a specialist in conservation. Where an immediate conservation need is identified this will be addressed to ensure item stability.

Stage 2 Archival Preparation

Three tasks are required in stage 2 in relation to the material archive, marking in accordance with Oriel Museum guidelines, X-raying metal objects and boxing the finds and human bones for long term curation. There will be some need to carry out X-ray photography of metal objects to be able to identify them and assess their significance. Finds, mainly pottery, will need to be marked as appropriate. As some Prehistoric and Roman pottery is of a sandy fabric this can sometimes be difficult to place a mark directly on the fabric so clear nail varnish is required to prepare the location of the mark. Following marking the finds will be bagged and boxed. The archive boxes need to be made of acid free cardboard for long term conservation storage and will need to be purchased specifically for the project.

The documentary archive should have been appropriately ordered, indexed and catalogued before it left site, but it will require checking and final cross-referencing before it can be assessed. The checking will involve both digital and paper-based records and include a finalisation of plan and section data, both hand-drawn and recorded through a digital medium. Relevant HER entries will need to be listed in full detail. All records will need security copies. Paper records (drawn plans, sections and record sheets) will be scanned for digital archiving. The digitisation of all hand drawn plans and sections is to be avoided as not cost effective. Drawings for digitisation can be selected in the analysis phase when it is known which drawings will contribute to the publication. This ensures that all digitisation will be 'heads up' and only for the purposes of report illustration rather than 'heads down', thus removing the need for digitisation tablets and increasing efficiency.

Stage 3 Data Assessment

In all cases the assessment begins with a quantification of the items to be assessed, whether it be sample residues, finds or site records. The material archive assessment involves separate

assessments of ecofacts, artefacts and any human remains. Further details of the finds assessment are contained in appendix 3.

Every flot and retent will be examined to establish whether they contain plant macrofossils, zooarchaeological remains, snail shells etc, artefacts or metal working residue. Ecofacts, residues and any artefacts are then extracted and examined. Ecofactual assemblages are identified and characterised. The assessment of individual ecofactual assemblages must be undertaken by a suitably-qualified palaeoenvironmentalist.

The finds assessment involves the quantification, identification and dating of the recovered artefacts. The finds assessment can only be compiled by a suitably-qualified finds specialist who can identify and spot-date the artefacts. Where necessary, specialists with local expertise will be consulted, especially regarding the pottery assemblages.

Radiocarbon dating, or any other form of absolute scientific dating, will be undertaken at the assessment stage, though some samples may need to be sent for testing to identify their suitability for dating. As this is an assessment a full suite of dates suitable for Bayesian analysis will not be undertaken but the potential for such future work will be highlighted in the UPD. The documentary archive assessment involves identifying each site's stratigraphic phases assisted by a Harris Matrix. It is required that this will be done using the Harris Matrix generator software. Duplicate and false contexts will be identified, recorded and discarded.

Stage 4 PXA and UPD Reporting

Stage 4 results in the creation of the PXA report and the UPD. A detailed template for producing these documents follows. The documents produced will be technical grey literature reports and not publication reports.

Report Template

The following report template is laid out in accordance with the desired structure and layout of the report. Sentences in italics refer to the required illustrations whether drawings or photographs.

1. Non-technical summary, including reasons for work, aims and summary results

2. Introduction

- 2.1 Site location (include eight digit NGR), site code/ PRN reference, and Event Number
- 2.2 Scope of the project.
- 2.3 Dates/duration of fieldwork.
- 2.4 Outline of the site's character (including topsoil, subsoil and substrata descriptions, past land use impacts on preservation and impact of bioturbation) and how the site fits into the local archaeological landscape.
- 2.5 Brief summary of previous work including directly relevant nearby sites (i.e. likely to be part of same archaeologically represented activity), geophysical results, metal detecting results and evaluation results.
- 2.6 Explanation of the purpose of the assessment report and organisation of the report (refer to this report template and include as appendix 1).
- 2.7 Site location map related to the development area.
- 2.8 Plan of site and excavated area (usually these will be the same).

3. Summary of the excavation methodology

- 3.1 Proposals set out in the approved Written Scheme of Investigation for the fieldwork (copy of the Written Scheme of Investigation sections 4 and 5 only as appendix 2).
- 3.2 Any variations from the Written Scheme of Investigation with justifications.
- 3.3 Site planning strategy with justifications for the applied methodology.
- 3.4 A description of any avoidance strategies or re-burial methods used to preserve unexcavated archaeological remains in situ, indicating whether or not these will be subject to a monitoring scheme and, if so, providing a description of it or references to supporting relevant documentation.

4. Site archive

- 4.1 Summary details of the contents and organisation of the project archive
- 4.2 Quantification of documentary archive (including catalogues and indices) and details of current (give date) location of the paper archive. Details of the digital archive and arrangements for storage security.
- 4.3 Summary of work carried out on the documentary archive during post-excavation assessment.

- 4.4 Quantification of material archive (by storage box) and details of current (give date) location.
- 4.5 Summary of work carried out on the material archive, including nature of processing and cleaning, and any necessary preliminary conservation/stabilisation.
- 4.6 Details of any samples sent for scientific analysis or dating as a necessary precursor to costing a programme of analysis.
- 4.7 Agreed destination of the site archive (in all instances this will be the Oriel Museum, Anglesey) with a statement of any receiving repository conditions if necessary.
- 4.8 OASIS reference supported by completed data collection form as appendix 3.
- 4.9 Representative sample photographs of site features that aid understanding of the assessment of stratigraphic data.

5. Stratigraphic data

- 5.1 Summary of the nature of the investigated features/deposits described by phase in chronological order (not by individual context or feature), supported by a Harris matrix/matrices in appendix 4 (use context group numbers if appropriate).
- 5.2 Statement of significance of the stratigraphic data.
- 5.3 Final pre-excavation plan.
- 5.4 Either an overall plan for all phases or individual phase plans or both as appropriate to the site's complexity.
- 5.5 Sections of key features with a location plan showing position of sections.
- 5.6 If relevant a more detailed plan of key structures.
- 5.7 Where relevant a structure through motion model illustration(s).

6. Artefacts

- 6.1 Quantification (by weight in grams for bulk finds) of finds by type.
- 6.2 Description of condition, stability and the immediate and longer term conservation and storage needs by artefact group.
- 6.3 An assessment of the character, range and variety, date, meaning and significance of all recovered artefact groups.
- 6.4 Statement by a recognised specialist on the research potential of each individual artefact group. If no further work beyond assessment is considered necessary this should be clearly indicated.

- 6.5 Statement of significance for the retention of material and a proposal for a fully justified discard strategy for low/nil value assemblages, in agreement with GAPS/CADW.
- 6.6 Supporting finds illustrations at appropriate scales (for the assessment wherever practicable scaled photographs should be used rather than line drawings).

7. Palaeoenvironment

- 7.1 Quantification (by weight in grams) of the retents and flots available for analysis. Quantification by sample bucket where further portions of a sample are available and the assessment sub-sample has revealed that further sample processing is worthwhile for the additional data it may reveal. Sub-sampling will have been sufficient to characterise and understand a sample.
- 7.2 Factual summary of each type of sample (e.g. bulk organic, dendrochronological, monolith), quantity, preservation, post-depositional processes, curation and storage need by ecofact group.
- 7.3 An assessment of the character, range, variety and significance of all ecofactual groups (likely to include plant macrofossils, pollen, animal bone, shell, snails and insects).
- 7.4 Statement by a recognised specialist on the research potential of each individual ecofact group, including potential to provide scientific dating. If no further work beyond assessment is considered necessary, this should be clearly indicated.
- 7.5 Statement of significance for the retention of material and a proposal for a fully justified discard strategy for low/nil value assemblages, in agreement with GAPS/CADW.
- 7.6 Representative photographs of key assemblages.

8. Human remains

- 8.1 For inhumations quantify by number of burials and then summarise information on skeletal completeness in a table divided as >75%, -75%, -50%, <25%. For cremations, bone remains from each context should be quantified by weight in grams.
- 8.2 Factual data about the bone assemblage, describing the provenance of the skeletal material and the general condition of the remains. The condition of the bone will influence the information that can be gained from the assemblage.
- 8.3 Statement by a recognised specialist on the research potential of the human remains.

- 8.4 Note on the long-term arrangements for the curation or reburial of the human remains.
- 8.5 Plans showing the location of burials or other deposits of human remains
- 8.6 Photographs and/or drawings of inhumation burials in situ or a structure through motion 3d model.

9. **Discussion**

- 9.1 A brief summary of the character and significance of the site as represented through its stratigraphic, artefactual and palaeoenvironmental data. Include where relevant the results of any documentary research. If no further work beyond assessment is considered necessary, this should be clearly indicated. If further work is required then include 9.2, 9.3 and 9.4 below.
- 9.2 A tabulated list of relevant sources discovered (relevant books, articles, HER data, archival sources) quantity, variety, level of study of sources during post-excavation assessment.
- 9.3 Indicate applied studies that will be necessary for further analytical work. These might include, for example, comparative analysis, archival and/or cartographic research and intra and inter-site spatial analyses, site morphological studies, absolute dating methods, scientific techniques not covered by the standard suite of applications (e.g. specific chemical analyses, thin sectioning for soils or ceramic research, isotope studies, scanning electron microscopy, specific biological analyses etc).

10. Statement of potential

- 10.1 A summary of the potential of the data in terms of local, regional, national and international importance, referencing as relevant regional and national period and subject specific research agendas. This should include:
 - an appraisal of the extent to which the site archive might enable the data to meet the original research aims of the project;
 - a statement of the potential of the data in developing new research aims, to contribute to other projects and to advance methodologies;
 - an assessment of the relevant level at which the site data might be published e.g. site specific publication, project landscape overview or background contextual data (choose one only).
- 10.2 An informed strategy for the detailed analysis of some or all data groups as recommended by relevant specialists to enable a reconstruction of the history and use of the site to be developed, in line with the site's relevant research potential

(where no further work is recommended this section is not required). This strategy must include provision to incorporate the results of any earlier phases of archaeological work on a specific site, reappraising materials and artefacts recovered during earlier assessment and evaluation phases and, where appropriate, earlier excavation results - including, where possible, from neighbouring sites

10.3 Map of the site in context at a regional or local level, showing other relevant sites and where appropriate connections and networks.

11 Bibliography of sources used in the compilation of the PXA

12. Updated Project Design

- 12.1 Introduction including purpose of the UPD to provide details of a programme of analysis leading to the appropriate mechanism for the dissemination of the results of the project. Also, to provide a basis for costing the programme of analysis, publication and deposition of the archive.
- 12.2 Justification for the contents of the proposed programme of analysis and any theoretical approaches to be deployed, in relation to the site's statement of potential and proposal for publication/dissemination as appropriate:
 - inclusion of main results in an overall synthetic volume only
 - thematic paper on a specific research theme
 - internet publishing through journal or proprietary website (stating whether all catalogues will be available and interactive)
 - short illustrated site report for a journal
 - section/chapter in edited monograph
 - fully illustrated site monograph
 - popular booklet (additional publication only and not to be the primary publication).
- 12.3 Proposal for analysis of the stratigraphic data concentrated on key feature groups.
- 12.4 Detail of illustrations required to support the stratigraphic analysis.
- 12.5 Detail of retention and discard strategy for the material archive.
- 12.6 Proposals for scientific dating (potentially an initial suite of dates and a second after provisional results from the artefact and ecofact analysis are received).
- 12.7 Proposals for a Bayesian analysis to refine chronologies, following consultation with Cadw regarding to the selection of contexts and samples for scientific dating.
- 12.8 Proposals, where relevant, for other forms of scientific analysis such as lipids, strontium or oxygen isotope analysis.

- 12.9 Details of illustrations required to support the artefact analysis.
- 12.10 Requirement for conservation works on material archive.
- 12.11 Proposals for further research, including archive visits and comparative analysis of other investigated relevant sites in order to contextualise the site data.
- 12.12 Details of resultant technical/archive report.
- 12.13 Publication report synopsis where relevant, including any additional illustrations required.
- 12.14 Proposals for monitoring and continued liaison with GAPS and CADW throughout the post-excavation analytical programme.
- 12.15 Staged programme and timetable for any proposed further work up to and including publication and archive deposition. Task list and Gantt chart.

Task breakdown for PXA

- 1. Processing
- 1.1 Environmental sample processing
- 1.2 Cleaning human remains
- 1.3 Bulk finds cleaning
- 1.4 Small finds cleaning
- 1.5 Artefact stabilisation
- 2. Archival preparation
- 2.1 Finds marking
- 2.2 X-raying metal objects
- 2.3 Archive box purchase
- 2.4 Boxing
- 2.5 Site record checking and cross-referencing
- 2.6 Compilation of list of archival sources
- 2.7 Records scanning
- 3. Data assessment
- 3.1 Zooarchaeological remains
- 3.2 Insects
- 3.3 Snails
- 3.4 Shells
- 3.5 Plant macrofossils
- 3.6 Pollen

- 3.7 Bulk finds
- 3.8 Small finds
- 3.9 Absolute dating laboratory consultation
- 3.10 Scientific analyses specialist consultation
- 3.11 Creation of phased matrices
- 3.12 Incorporation of phased data into project GIS
- 4. Reporting
- 4.1 PXA
- 4.2 UPD

APPENDIX 1 METHOD STATEMENT: STAGE 1 FINDS PROCESSING

Finds processing and assessment summary

At stage 1 the finds will be cleaned (usually but not always involving washing). At stage 2 the finds will marked, bagged and boxed. Once this is done in stage 3 the finds will be quantified and assessed; this involves the creation of an Excel spreadsheet into which are recorded numbers of items, weight and spot-dating and the finds are cross-referenced to the stratigraphic contexts from which they were derived. Having done this in stage 4 a report will be prepared on the assessment results. The work will be solely aimed at identifying significant assemblages for further future analysis as will be detailed in the Updated Project Design. The following specification allows for the cleaning of bulk finds.

Washing and cleaning

Bulk artefacts (pottery, animal bone, glass, ceramic building material) are bagged up on-site and returned to the post-excavation department. The finds are washed and cleaned using two bowls (one to wash, one to rinse) and toothbrushes. The finds are placed in trays linked with newspaper – the site code, context number and (if applicable) the small find number is written either on the newspaper or on a tag attached to the tray with permanent marker. To increase the efficiency and speed of the finds' drying time, a drip-tray system is employed in

which finds are put on newspaper first before being placed in the tray. This ensures excess water is soaked up (and is particularly useful for large, heavy fragments such as architectural stone and ceramic building material).

Organic finds are processed differently and will depend on whether they have been recovered from waterlogged deposits; leather, shale, jet, wood and worked bone that has been recovered from waterlogged deposits needs to be kept dark, dry and cool. Objects are cleaned primarily with soft wet brushes and they are bagged (with water in the bags) and are put in an organics fridge.

All metalwork (including copper alloy, lead and iron) and oyster shell is dry-brushed. Delicate metal and non-metal small finds are dry-brushed and placed in crystal boxes in trays on acid-free tissue paper. Plaster/mortar are dry-brushed and placed in labelled trays.

Human remains (cremated and non-cremated) are processed differently and will require different cleaning methods depending on their state of preservation. Non-cremated articulated and disarticulated human remains in good condition will undergo the same processing as bulk finds, but the bones are not immersed in water. The human remains will only be marked depending on the requirements of the curator and county repository. Human remains in poor condition must not be wet-washed and will have to be dry-brushed for remains to stabilise.

Time estimates for finds washing and cleaning

It must be emphasised that finds washing is hugely dependent on a wide range of variables, including the original burial environment (acidic soils, different soil types e.g. clay versus sand) and previous activity on the site (agricultural activity such as ploughing may damage the finds).

Find type	Weight	Time
Prehistoric pottery	1kg	1-2 hours
Roman pottery	1kg	1-1.5 hours
Saxon pottery	1kg	1-1.5 hours
Medieval pottery	1kg	1 hour
Post-medieval pottery	1kg	1 hour
CBM & daub	1kg	1-1.5 hours
Animal bone (good condition)	1kg	1-1.5 hours
Animal bone (bad condition)	1kg	1-2 hours

Human bone (complete skeleton, good condition)	7-8kg	1-1.5 days
Human bone (bad condition)	1kg	1-2 days
Glass	1kg	1-1.5 hours
Metalwork	1kg	1-1.5 hours
Oyster shell	1kg	1-1.5 hours
Flint	1kg	1 hour
Stone	1kg	1 hour
Leather	1kg	1-1.5 hours
Archaeometallurgical waste	1kg	1 hour
Plaster/Mortar	1kg	1-2 hours
Clay Pipe	1kg	1-1.5 hours

APPENDIX 2 METHOD STATEMENT: STAGE 1 ENVIRONMENTAL PROCESSING

Environmental processing and assessment summary

For environmental samples in stage 1 the samples will be processed. In stage 2 this material will be dried, bagged and sorted. In stage 3 this material will be examined to establish whether or not they contain plant macrofossils, zooarchaeological remains, artefacts or metal working residue. Having done this in stage 4 they will be required to prepare a report on the assessment results. They will not be instructed to analyse the materials derived from the flots and retents at the assessment stage. The work will be solely aimed at establishing significant flots and retents for further future analysis as will be detailed in the Updated Project Design. The following specification allows for the processing and assessment of bulk environmental samples and for waterlogged materials from a General Biological Analysis sample (GBA).

General Biological Analysis sample

The colour, lithology, weight and volume of the sample will be recorded on the sample sheet. The sample will be then be processed. All samples will be floated on a 250-300 mm mesh and the heavy residues washed over a 0.5-1 mm mesh as required by SCCAS. The flot should be air dried.

The flot should be 100% sorted with all relevant material being recovered, once this process has been completed, the remaining material may be discarded. Any plant remains should be quantitively recorded. All ecofactual material should be removed as should relevant artefactual material. Earthworm and nematode capsules should be counted but not recovered. If charcoal-rich a 2mm sieve should be used, the resultant material should then be

subject to the same process outlined above. The data from the flot sorting should then be recorded into a spreadsheet (Excel) or database (Access).

Once dried the entire retent residue should be sorted. In order to ease sorting, the dried residues may be passed over a 4mm mesh, this also aids charcoal retention of a suitable size for ID. The dried residues should be described (colour, lithology, weight and volume of the individual fractions).

The <4mm fraction will be scanned with a magnet in order to pick up micro-slags, and 100% sorted for the recovery of artefacts and ecofacts.

The fine fraction will be sorted and any relevant material recovered. The sorted residues can then be discarded. Any resulting artefactual and ecofactual material should be recorded (abundance/actual quantities dependent on material and weighed).

Recording of the Environmental Data

Where possible quantify, counts of over 50 individuals per species can be referred to by levels of abundance, such as +=50-100, ++=100-200, +++=200-500 and ++++ to indicate greater than 500. If identification is not to species level then a distinction between cereals and weeds species (or non-economic taxa) should be made. The presence of chaff should be noted.

For long term storage, the plant remains should be stored in soda glass tubes with sample information, and identification (where relevant) clearly marked using pencil and a Tyvek label placed inside the tube.

Waterlogged Samples

Between 250 and 500ml of a 1l sub sample from the GBA is processed by placing the material in a $500\mu m$ sieve and washing the sample through until all of the sediment has been removed. The latter is essential or the fluid in which the sample is stored will become cloudy. Once clean the sample is removed from the sieve to an airtight jar and stored in ethanol (95% alcohol).

Paraffin Flotation

The remaining 9I of the GBA will be placed into a bucket filled with hot water to disaggregate the sample. A handful of the material is then placed in a $300\mu m$ sieve and washed until as much of the sediment as possible has been removed. The material is then tipped from the

washing sieve into a further sieve and allowed to drain and dry. Once the sample has been completely processed, it will then be left to dry for an hour. The sample is then tipped back into the bucket and enough paraffin to coat the sample is added –multiple buckets may be required if the sample is large. This will be then allowed to stand for 15 minutes and cold water added to the bucket.

The bucket is then allowed to stand for a further 15 minutes. At this stage any insect sclera should have risen to the surface of the water as the paraffin adheres favourably to the chitin which forms the exoskeleton of the beetle. The top 2cm of bucket is then poured off through a 300µm sieve and this process is repeated twice more.

At the end of this process, the flots within the sieve will be washed using domestic washing up-liquid until all traces of both the paraffin and detergent have been removed. The latter is essential as any trace of either left on the flot will render the storage medium cloudy. The sample is then stored in ethanol (95% alcohol) inside an airtight jar.

METHOD STATEMENT STAGES 2 AND 3 FINDS ASSESSMENT

Summary

The finds assessment involves the quantification, identification, dating and significance assessment of the recovered artefacts. The assessment of significance happens in stage 4 when the context of the finds can be taken into account as their significance is not solely based on the object's intrinsic interest. The finds assessment can only be compiled by a suitably-qualified finds specialist who can identify and spot-date a wide range of artefacts.

The finds assessment will adhere to a number of national guidelines, including CIfA (2017), Historic England, EAC (2014), Brown (2011) and Watkinson & Neal (1998) as well as the specific county museum's own standard requirements plus national and regional fabric codes (prehistoric through to post-medieval pottery). The finds assessment will make recommendations to be included in the UPD (updated project design). These may include further literary research and comparative analysis, AMS C14 dating, strontium or oxygen isotope analysis, Bayesian scientific methods plus illustration / photography.

The following specification allows for the quantification, identification and dating and significance assessment of the finds.

Stage 2

Certain types of find, when dry, are then marked; this can be dependent on the curator and the county repository. Finds, including pottery, CBM, animal bone, glass and clay tobacco pipe, are marked with the site code, context number, small find number and the museum accession number (if applicable). The finds are marked using permanent Indian ink (Winsor & Newton); for finds with rough surfaces (applicable to all types of pre post-medieval pottery), a small patch of acrylic or nail varnish is applied to provide a smoother surface.

Types of finds and ecofactual remains that are not marked include human bone, leather, shale, jet, all metalwork, plaster/mortar, oyster shell, slag and wood.

Once the finds are dry and marked, they are quantified and bagged in zip-lock self-sealable bags and the site code, context number, small find number and museum accession number is written on the bags. For small finds and delicate/fragile artefacts, 2 layers of acid-free ridged

foam is cut and inserted into the bag beforehand and the artefact is sandwiched between the two layers.

The non-metal artefacts, when bagged, are placed in acid-free archive boxes and they are ordered by material type and by context. Boxes should not weigh over 6kg. Metal artefacts and some organic finds are kept in Stewart tubs with a bag of silica gel and humidity strip indicators. WA Ltd's in-house archive labels are then put on the front of the box.

Time estimates for finds marking and bagging and boxing

Marking 30-40 seconds per artefact e.g. per bone, per pot sherd.

Bagging and boxing 1 box at 6 kg full capacity – 30-40 minutes.

Stage 3

Once processed (cleaned and dried stage 1 and marked stage 2) the finds will need to be assessed. In stage 3 preliminary recording and description of the assemblage is undertaken and an Excel spreadsheet is created. This stage is where the artefacts are quantified, weighed, spot-dated and where additional comments / notes are made. The Excel spreadsheet (or Access database) forms a critical part of the finds assessment and every finds report must have one. The preliminary recording is conducted by a suitably-qualified finds specialist, with a proven record and appropriate local knowledge.

Time estimates for preliminary recording

Recording and describing 1 box (6 kg) of finds = 1-3.75 hours dependent on the nature of the items.

Materials costs to be considered to PXA

In addition to the person costs there is a material cost for storage materials, including boxes, silica gel, acid free tissue and zip-lock bags, for the artefacts and the human bone. For example, finds and documentary archive boxes need to be acid free for long term storage. Appropriate temporary storage and monitoring of waterlogged artefacts is required, prior to conservation.

There will be some need to carry out X-ray photography of metal objects to be able to assess their significance.
