INTRODUCTION

The Hafren Archaeological Assessment forms part of the second phase of the Forest Enterprise Welsh Heritage Assets Project contract, as specified in the Forest Enterprise Welsh Heritage Assets Project Brief. It covers 3821ha and lies within the Canolbarth forest district in Powys. The archaeological survey is intended to correct the deficiency in archaeological understanding of the forest, to lead to better management of the archaeological resource and to enhance the public understanding and enjoyment of the natural and cultural landscape in Forest Enterprise's care.

The Contracts Section of the Clwyd-Powys Archaeological Trust was awarded the contract in March 1998. Work commenced in April 1998 and was completed at the beginning of June 1998. The following report, gazetteer, and printed maps fulfil part of the project brief. Accompanying this report is the digital data on CD-ROM and floppy disc fulfilling the other part of the project brief.

SOURCES

The following sources were consulted as part of the project. An outline of the level to which these sources were consulted follows the description of each source as does an assessment of their usefulness. A list of sources follows the bibliography and gives a detailed list of cartographic and documentary sources.

The Regional Sites and Monuments Record

The relevant Sites and Monuments Record (SMR) is that held by the Clwyd-Powys Archaeological Trust. The data was supplied in digital form as a MapInfo table with relevant fields organised into the format required by the Forest Enterprise Welsh Heritage Assets Project Brief. A 100m buffer was used to identify sites recorded as lying on or just outside the Forest Enterprise boundary. Experience has shown that some of these sites lie on or just inside the Forest Enterprise boundary. The paper record of the SMR was also included in the data provided and this included information not included in the digital database. Other documents held by the SMR including CPAT reports were studied in the offices of the SMR in Welshpool.

81 sites existed in the SMR. It is the most comprehensive list of archaeological sites available and it included all the major mining sites, agricultural sites and prehistoric features. The major mine sites have been the subject of a rapid survey of metal mine sites in Powys (Walters 1994) which identified the important archaeological resource represented by these remains.

The present project has identified 119 new sites. To a certain extent this is the result of dividing the mine sites into their individual parts to facilitate the giving of management advice, but it still suggests that the SMR for Hafren existing prior to the survey was significantly deficient. Other inconsistencies in the record largely reflect the way in which the data has been gathered. As a comprehensive record it contains sites which have been collated by a number of people, with varying degrees of accuracy. Eight cropmark sites identified from Royal Air Force aerial photographs were included in the data (PRNs 1388, 1389, 1393, 1394, 1457, 1458, 1528 and 4320) which are probably unreliable as the upland ground conditions of the pre-forestry landscape is unlikely to produce such cropmarks. The photographs from which these sites were identified have been studied as part of the present project and the features recorded are not thought to be archaeological. Field visits (including those carried out by the Ordnance Survey in the 1970s and 1980s) have failed to find the sites. Other sites included a find spot (PRN 3493) which has no physical presence and three sites (PRN 8496, PRN 8667 and PRN 1387) which were incorrectly located.

The Second edition Ordnance Survey 6" maps

Copies of the second edition of the Ordnance Survey" maps, published in 1903 in the survey area, were obtained as first generation photocopies from the National Library of Wales in Aberystwyth. The maps were digitised following the methodology defined in the Forest Enterprise Welsh Heritage Assets Project Brief, and included in the summary of the methodology and its effectiveness included below.

The maps were found to be a useful and accurate source for identifying particular types of site including agricultural buildings, trackways, field boundaries, and areas of woodland. The main structures of the mining sites were also identified, though field survey has indicated that many elements of the sites were not recorded in detail. At Nant yr Eira, for example, the tramways, spoil heaps, buddles and leats were not identified. Levels and shafts were not always identified, such as PRN 15116 and PRN 15117, also at Nant yr Eira. In Hafren, however, the depiction of the mining on the second edition was relatively good as the mining industry in the area had largely ceased by the turn of the 20th century.

The larger prehistoric sites were also identified on the maps, including the scheduled barrows Clap Mawr (PRN 1383; SAM Mg 171 (POW)) and Pen Pumlumon (PRN 6043; SAM Cd 035 (CER)). The important standing stone known as Garreg Wen (PRN 819) was also identified.

The methodology employed in capturing this source, outlined below, meant that the maps gave an accurate location for the sites. This is estimated to be below 15m in all cases, but is generally to below 10m.

Later editions of the Ordnance Survey

The third edition of the Ordnance Survey 6" map, published in 1928 in the survey area was studied. This showed that the landscape had been relatively stable in the early part of the twentieth century, and minor changes in the alignment and number of boundaries were the only changes identified. The major change visible on the modern Ordnance Survey map is the building of the Clywedog dam in the late 1960s.

Aerial photographs

The vertical collection of aerial photographs held in the National Monuments Record library at the Royal Commission on the Ancient and Historical Monuments of Wales was studied. This was comprehensive and held all the relevant sorties and frames for the Hafren area. It was therefore not considered necessary to consult the collection of the Central Registry for Aerial Photography held by the Welsh Office in Cardiff. The best sortie was 541/59, taken in low sunlight in 1948, prior to the planting of the forestry. The small scale of the photography (1:10,000) meant that individual features such as the Pen Pumlumon barrow (PRN 6043), the Carreg Wen standing stone (PRN 3049), and the Nant yr Eira mine site (PRN 725) could not be identified on the photography. The field system associated with the Cwm Biga Bach enclosure (PRN 26901) could be identified and was more detailed than represented on the Ordnance Survey map.

A small number of oblique photographs are held by the Clwyd-Powys Archaeological Trust in their offices at Welshpool. These were taken as part of the Scheduled Ancient Monument monitoring programme and did not reveal any new features.

Forest Enterprise Records

Conservation plans, stock maps and constraints maps were studied. Little archaeological data appeared on the stock maps, indicating the deficiency of Forest Enterprise's knowledge of archaeological features in the forest.

Recent records produced by the planning team were of use in areas studied as part of the planning process. In particular this identified a leat (PRN 15092) which would otherwise not have been identified.

A previous forester in the area also had a keen interest in the local mining industry, and had kept detailed notes on the mining buildings, and location of shafts. He had also collected together several published sources relating to this activity.

Forest Enterprise staff

Field visits were accompanied by the Forest Ranger. This was invaluable in identifying sites of interest and in guiding field visits.

Tithe Maps

Tithe maps were studied at the National Library of Wales in Aberystwyth. The tithe maps were of little use in identifying new sites, largely because most of the area covered by the forest appears to have been open, unenclosed land in the middle part of the nineteenth century and therefore not mapped in detail. The farmsteads shown on the Ordnance Survey second edition 6" map were shown with minor alterations in the surrounding fields. Little evidence of mining activity was recorded on the maps.

First Edition Ordnance Survey 6" maps.

Photocopies of the first edition of the Ordnance Survey 6" maps, dating to 1891 in the survey area, were obtained from the National Library of Wales in Aberystwyth. Comparison of the map with the second edition of the map indicated that there had been little change in the area in the second half of the nineteenth century other than the realignment and removal of boundaries and the clearance of small areas of woodland.

First Edition 1" maps

The first edition of the Ordnance Survey map, published in 1836, shows several features within the forested area. Although no new sites were identified the maps provide the earliest depiction of the farm sites at Hore (PRN 26898), Blaen Hafren (PRN 26899), and Rhyd y Benwch (PRN 15105). Of the mine sites, the only one recorded is at Nant Melin (PRN 18995) while the earthwork site at Cwm Biga Bach (PRN 26901) is

mapped as a farmstead named Cwm Biga Uchaf. Prehistoric features, including Carreg Wen (PRN 819) are also recorded.

Ordnance Survey Surveyors Drawings

The Ordnance Survey surveyors drawings, compiled at 2" scale and dating to 1822 and 1833 in the survey area, showed little difference from the 1" published map. No new sites were identified from this source.

National Monuments Record

The National Monuments Record (NMR) was studied in the NMR library in the offices of the Royal Commission on the Ancient and Historical Monuments of Wales in Aberystwyth. No new sites were identified from the NMR.

Estate maps and Records

The collections of the National Library of Wales and Powys County Council were studied. This revealed no estate maps which covered the Hafren forest.

Cadw: Welsh Historic Monuments Records

Copies of the scheduling records of Cadw: Welsh Historic Monuments were studied for the three existing scheduled sites in Hafren. The outlines of the scheduled areas held by the Clwyd-Powys Archaeological Trust were digitised, but it must be noted that the legal definition of the scheduled area is that shown on the Cadw: Welsh Historic Monuments scheduling map. The digitised area on the digital data should therefore only be taken as a guide.

METHODOLOGY

The methodology used to record archaeological features in the forestry from the sources listed above is described below. Its effectiveness in recording the total archaeological resource of the Forest is also assessed.

Digital Mapping

Due to inaccuracies of the stock maps the scanning and registering methodology outlined in the specification was not employed. After agreement with the Archaeological Co-ordinator the methodology employed was to project the corner co-ordinate points of the second edition maps and use these as control points when digitising. Digitising was conducted in MapInfo in the tables outlined in the Forest Enterprise Welsh Heritage Assets Project Brief.

Errors of up to 15m were apparent in the digital data when compared to the Forest Enterprise stock maps. This was partly due to the Cassini projection of the source map differing from the projection of the modern map, and partly because of errors in the stock map data. Quality Assurance procedures followed that outlined in the project specification.

Record Creation

Databasing in the SMR1 table conformed to that defined in the Forest Enterprise Welsh Heritage Assets Project Brief. It was carried out in MapInfo using the digitised map as background. Other map sources, such as the detailed plan of the mining remains at Nant yr Eira, were scanned using an A3 scanner and used as a background during the database creation to ensure accuracy. Database points created from other sources, such as those recorded during field visits but not recorded on the map sources, those recorded by Forest Enterprise staff, or on early maps or aerial photographs were placed with the greatest accuracy possible. Confidence in the accuracy of the site location is included in the site description where the source is derived from a source other than cartographic. Quality Assurance procedures follow those outlined in the project specification.

Field assessment

Field visits were made in the company of Forest Enterprise staff, which allowed easy access to the sites and meant that the safety considerations outlined in the specification could be met. Field visits were determined by the results of the digital mapping and desktop assessment. A number of sites were recorded during the field visits which had not been identified from other sources. The vegetation on the sites did not greatly hamper field recording.

The large number of mining levels and shafts recorded in the survey (70 sites) were only visited if they were close to significant structural mining remains. The sites are potentially very dangerous and therefore visiting was not considered appropriate.

Site visit forms were created to ensure all the relevant data was recorded relating to each site. These forms form part of the project archive.

Effectiveness of the Methodology

The methodology described above has recorded 204 sites of which 135 were new sites. In particular it has been effective in identifying post-medieval features associated with the agricultural and mining history of the area. It should be noted however that the survey is intended as a rapid survey from readily available sources. There is therefore likely to be unrecorded archaeology in the field which can only be identified from detailed field walking, which lies outside the scope of this survey. This may include potentially important earthwork features such as barrows and earthwork enclosures or insubstantial structures such as cairns. It may also include a large number of levels and shafts.

THE NATURE AND CONDITION OF THE ARCHAEOLOGY IN THE FOREST

204 records of individual sites were either created or updated as part of the project. Of these 69 were existing records and 135 are new records. A density of 0.053 sites per hectare was recorded, though this is slightly misleading as the mining sites have given rise to high densities of sites in particular areas compared to the lower overall density of sites in the forest which is somewhat lower. 56% of the sites were visited to record their condition and any potential threat. Management recommendations were also made for visited sites and they were categorised according to the categories outlined below..

71 shafts and levels related to lead mining exist in the forest (70 sites). These were only visited if they lay close to substantial structural remains of mining. Due to their potential danger other sites were not visited. If the levels and shafts, including those visited, are disregarded then the project achieved a visit percentage of 69%. The recorded condition of the mining sites and recommendations for management do not take into account safety considerations. This should be the decision of Forest Enterprise staff. The location of the shafts and the number recorded in the archaeological survey should not be taken as a full audit of this type of site as many are likely to exist in the forest which have not been recorded by the methodology employed by the survey.

Whilst the amount of archaeology in Hafren is fairly small the quality of the archaeology is fairly high both in terms of condition and importance. Important sites include two scheduled barrows (PRN 1383 and PRN 6043), the Carreg Wen stone (PRN 819), the Cwm Biga Bach enclosures (PRN 26901), the Hore House platform house (PRN 23907), and Nant yr Eira mine (PRN 725). The categorisation of the sites has produced 34 category A sites, 22 category B sites and 14 category C. 88 sites have yet to be evaluated and 15 sites have no physical presence. The high incidence of category A sites (30% of the total number of visited sites), is largely due to the Nant yr Eira mine site being divided into its separate elements.

Generally, the survival of sites within Hafren the forest is good. The prehistoric archaeology, largely on the margins of the forest have not been disturbed by ploughing, although some damage has been caused to PRN 1383 by burrowing animals. A number of agricultural buildings (including those at PRN 26898 and PRN 15105) have been deliberately demolished to make them safe, but some of the structures associated with the remains of mining are substantial. A number of levels and shafts associated with the mining activity have been recorded. Some have been identified which were not recorded on the map sources. This suggests that there may be further shaft sites which have not been recorded as part of the current project.

ARCHAEOLOGICAL SITE CATEGORIES

For the purposes of management, the sites recorded in the archaeological survey have been divided into five categories (*A to C; No Physical Presence; Not Yet Evaluated*). The broad divisions between these categories have been drawn on archaeological grounds, but each is tailored towards specific management aims. Each category is described archaeologically, lists management objectives and gives a management recommendation. Sites may be defined as a discrete monument (e.g. a farmstead, or a larger complex e.g. a field system or landscape).

Landscapes may be diverse and may include, for example, redundant field and settlement systems (comprising walls, banks, hedges, trackways, buildings or sites of buildings etc.), prehistoric ritual landscapes (such as barrow cemeteries, stone rows and settings), prehistoric settlement landscapes (such as hillforts with field systems), industrial complexes (such as areas of mining or quarrying) or relatively modern agricultural landscapes. The main criteria for selection is that the various elements should form a significant and coherent archaeological or historic whole. Survival and condition are not necessarily important when defining a landscape, for example the medieval Radnor Forest exhibits little or no surviving physical remains but it is a closely defined area where the long term exercising of Forest Law has shaped the current landuse pattern.

Using these categories, an evaluation of each site recorded during the survey has been attempted and sites labelled accordingly. This evaluation process will only be fully successful where, (a) existing records give full and up to date details of the site's form and present state of preservation, such as those already in the SMR or those with detailed records made by third parties such as the RCAHMW, or (b) where a visit has been possible as part of this survey.

Where insufficient information exists, for example where a site has not been visited by an archaeologist, it will be classified as '*Not Yet Evaluated*' in the database and printed gazetteer.

The categorisation of sites is an ongoing process requiring site identification and recording by Forest Enterprise in conjunction with the appropriate archaeological body. Categories are not immutable and where new information becomes available review may be considered.

The *management objectives* and *prescriptions* are intended to achieve either the preservation of archaeological remains *in-situ* (i.e. to retain and maintain the site in a stable condition and to actively protect it from further disturbance), or the preservation of archaeological remains *by record* (i.e. to preserve a record of the sites present state and form, but not necessarily to actively conserve it or protect it from further disturbance). This terminology is derived from government advice on the handling of archaeology in the planning process (Planning Policy Guidance Note 16 '*Archaeology and Planning*' - PPG16) and is that in common use in archaeology

The terms *regional importance* and *local importance* are used below as in PPG16.

The term *national importance* is used below as defined by the *non-statutory criteria for scheduling ancient monuments*. A site, or less commonly a landscape, may meet any one of, or combination of, these seven published criteria (period, rarity, documentation, group value, survival/condition, fragility/vulnerability, diversity, potential) and be deemed of national importance and therefore merit scheduling as an ancient monument under the 1979 *Ancient Monuments and Archaeological Areas Act*. Once designated, Ancient Monuments are protected by law and special permission (Scheduled Monument Consent) is required, from the Secretary of State, for any works effecting them. Cadw, who administer Scheduled Ancient Monuments (SAMs) in Wales, and English Heritage who perform a similar function in England, may enter into management agreements with owners of such sites. Forest Enterprise already has a number of agreements in place for SAMs on its holdings. These agreements are specific to each monument and take precedence over the general management prescriptions given below. Management plans for non-scheduled sites, where needed, will be drawn up with reference to the Archaeological Co-Ordinator for the project and the appropriate archaeological Trust.

Category A***Discrete archaeological monuments of national importance***

This category may include any site, whatever its form, which might meet the criteria for scheduling. It will by definition include all Scheduled Ancient Monuments (SAMs). Many sites in this category may be recommended for scheduling.

The main criteria for selection will usually be the rarity, condition and potential of the site. Typically, sites such as barrows, hillforts, linear earthworks or significant (ruined) buildings might fall in this category, although significant find scatters might equally well qualify on potential or relatively modern farmsteads on group value.

Management Objective

To maintain and enhance as a monument of national importance.

Management Prescription

Identify and record with a view to preservation *in-situ*.

A detailed management plan should be written for all sites in this category.

Category B***Discrete archaeological monuments and landscape features of regional or local importance***

This category may include any site, whatever its form, which while not meeting the criteria for scheduling may still be seen as of regional or local importance. For example, a type of site unique to a particular locality but common elsewhere, or severely degraded examples of commonly occurring types.

Management Objective

To maintain and enhance as a monument of regional or local importance.

Management Prescription

Identify and record with a view to preserving better examples *in-situ*.

Category C***Discrete archaeological monuments of lesser significance***

This category comprises sites which while being of archaeological or historical interest may not be worthy of conservation or active protection.

Management Objective

Identify and record as appropriate

Management Prescription

Identify and record sites during the course of normal forest management, with a view to preservation by record. No other archaeological management may be necessary, but conservation and protection might be offered, as appropriate, as a part of other schemes.

Category: No Physical Presence

Sites with no defined physical presence

This category comprises findspots, sites noted but not accurately located in antiquarian references, sites known only from placename evidence and other reported sites whose authenticity is in doubt (e.g. certain sites which have not been verified by recent archaeological fieldwork).

Where poorly located sites initially placed in this category are subsequently identified and recorded it may be appropriate to revise their categorisation.

Management Objective

Identify and record sites as opportunities arise. Assess their nature and condition.

Management Prescription

Identify and record site as appropriate during the course of normal forest management. Sites that cannot be located cannot be managed.

Category: Not Yet Evaluated

Sites which have not yet been evaluated

This category includes all sites which have not been evaluated. This may be because they have not yet been visited or because it has not proved possible to find them but they have not been shown conclusively to have been destroyed.

Management Objective

Sites such be located and visited to allow evaluation by a competent archaeologist.

Management Prescription

None is possible until such sites have been evaluated.

RECOMMENDATIONS FOR FURTHER WORK

Scheduling Recommendations

Cwm Biga Bach (PRN 26901)

Cwm Biga is known to have been a grange of Cwmhir Abbey in the medieval period (Williams 1990). Although the site of the grange has previously been thought to lie beneath the present Cwm Biga farm there is a strong possibility that the earthworks at Cwm Biga Uchaf may relate to the monastic holding. It is therefore recommended that aerial photographic rectification should be carried out to define the extent of the site and if appropriate a ground survey should be carried out when the present conifer crop has been removed.

The site is a possible candidate for scheduling depending on the results of the air photo rectification and ground survey

Garreg Wen (PRN 819)

Clear trees away from the woodland edge, to clear site lines to the open mountain to the east. The site should be considered for scheduling.

Nant yr Eira (PRN 725)

Consideration should be given to extending the scheduled area along the stream to the north to include the dam and levels (PRNs 18541; PRN 15116 and PRN 15117).

Sites for interpretation

Blaen Hafren (PRN 26898)

The former house site is largely destroyed although the site is part of a picnic area. Interpretation boards could therefore be established at the site. It could also include information on the sheep wash to the east.

Rhyd y Benwch (PRN 15105)

Though little is now visible it is close to an interpretation centre. Information could be given as to the previous history of the site.

Cwm Biga Bach (PRN 26901)

Close to the earthworks at Cwm Biga Bach is the Cwm Biga farm which is currently used as a public interpretation site. The earthworks could be interpreted for the public with display boards depicting the site and describing its medieval context as a Cistercian grange associated with Cwmhir Abbey.

DESCRIPTION OF THE ARCHAEOLOGY OF HAFREN

The Hafren block lies on the eastern side of the Pumlumon mountain in the south-western part of the former county of Montgomeryshire. Before afforestation it was primarily open moorland with agricultural land on the eastern edge and stretching up the valleys.

Several large and important prehistoric features lie within Hafren Forest. Two scheduled barrows (PRN 1383; SAM Mg 171 (POW) and PRN 1383; SAM Cd 035 (CER)) indicate the human activity in the Bronze Age, as does the impressive quartz Carreg Wen standing stone (PRN 819). The open-cast cut at Nant yr Eira is believed to have been started in the Bronze Age to exploit the copper deposits. Stone mauls and antler picks have been recovered from its base. Radiocarbon dating of charred wood recovered from the spoil tips has suggested working in the early Bronze Age (between c2000-1500 BC). Opencast workings at Nant y Rickett (PRN 17468) has also been suggested as a Bronze Age site.

No direct evidence of human activity has been recorded from the Iron Age, but Roman activity has been suggested at Nant yr Eira.

During the medieval period the area was part of the holdings of the Cistercian abbeys at Cwmhir and Strata Marcella. Indeed, the area was in dispute during the 13th century (Williams 1990). The grange of Cwmhir was based at Cwm Biga, and the earthworks surviving within the forestry (PRN 26901) may relate to the grange. The economy of the grange was largely based on stock rearing due to its upland location, though it is probable that the Cistercians also exploited the lead deposits of the area. Some of the old levels and earthworks recorded in the forest may be a result of this activity.

Many of the farmsteads probably have their origins in the later medieval and early post medieval periods, though there is no direct evidence of this. There are mostly typical upland farms within large fields. The site at Blaen Hafren has a distinctive sheep wash, illustrating the largely pastoral economy.

The lead mining in the area was probably at its height during the late eighteenth and early nineteenth centuries. There are impressive remains of this industry at Nant yr Eira (PRN 725) and Rhoswydol (PRN 5940). There are also a large number of shafts and levels in the forestry which are of uncertain date.

Gazetteer of Archaeological Sites in Hafren Forest

PRN	725	Nant yr Eira Mine			Compartment	3125
Part of	725	NPRN	0	SAM	District	Canolbarth
				Mg226(POW)		
Mine (Lead/Copper)				Multiperiod	NGR	SN8270087300

Description

Lead/Copper mine, worked periodically from Bronze Age until late 19thC. Includes a large Bronze Age open cast from which stone mauls have been recovered (PRN18531). The remains of the 19th century include a well preserved crusher house (PRN 18537).

Condition

Site is in managed open area. Small amount of conifer regeneration. Parts of the site to the north lie outside scheduled area.

Recommendations

Recommend extension of scheduled area to include reservoir and levels to N and mine office to W. Control regeneration of conifers.

Management Category: A **Visited On** 11/05/98

PRN	819	Carreg Wen Stone			Compartment	3049
Part of	0	NPRN	0	SAM	District	Canolbarth
Standing stone				Prehistoric	NGR	SN8293688540

Description

A standing stone consisting of a white quartz block c 1.75-2m high by 0.75m thick by 1.25m wide.

Condition

Conifer regeneration on W and S sides. Plough furrows have come to within 4m of the monument. A hollow on the western side of stone.

Recommendations

Remove regenerating conifers from W and S sides, including the fallen tree. During re-stocking ensure that open ground is left between the monument and the edge of the forest. Recommend for scheduling.

Management Category: A **Visited On** 11/05/98

PRN	1383	Clap Mawr Barrow			Compartment	3012
Part of	0	NPRN	0	SAM	District	Canolbarth
				Mg171(POW)		
Round barrow				Bronze Age	NGR	SN8807891575

Description

Round barrow, 1.6m high, 20m diameter. A 5m wide, 1m deep, trench has been cut across the north-east edge.

Condition

Scheduled monument in good condition. Trees grow within 10m of the barrow. Some animal disturbance and conifer regeneration.

Recommendations

Clear conifers from an area of 15m surrounding the barrow. Control regeneration.

Management Category: A **Visited On** 21/05/98

Part of	0	NPRN	0	District	Canolbarth
House			SAM	NGR	SN8324086810
			Medieval		

Description

Remains of stone structure representing a medieval longhouse. To the north of a small stream. Surrounded by small enclosed fields.

Condition

Walls survive up to 0.5m. Located in riparian zone with some broadleaf regeneration. Recent robbing of stone from structure.

Recommendations

Control robbing of stone and remove regeneration.

Part of	0	NPRN	0	District	Canolbarth
House			SAM	NGR	SN8334287096
			Post medieval		

Description

Site of former house. All that now survives are two stone walls lying parallel to each other. To the north of the site the ground has been built up for the construction of a forest road. The house is shown on OS 1885, 1903 and 1964 maps.

Condition

Parts of the walls are visible standing up to 2m high. Potentially well preserved beneath rubble.

Recommendations

Maintain in present condition. Remove any conifer or broadleaf regeneration.

Part of	15132	NPRN	0	District	Canolbarth
House ?			SAM	NGR	SN8362688386
			Post medieval		

Description

Site of former farmstead, including two buildings and ash trees for shelter. Difficult to establish the arrangement of the buildings due to the lying rubble. The surrounding field systems are visible.

Condition

Parts of the buildings are visible standing to c. 2m and it is probably preserved in good condition beneath the rubble. Some broadleaf regeneration. Part of picnic area.

Recommendations

Remove broadleaf growing out of wall at the S end. Otherwise preserve in present condition. Potential for simple public interpretation as close to established picnic site.

Part of	0	NPRN	0	District	Canolbarth
			SAM		
Sheep wash			Post medieval	NGR	SN8375888338

Description

Series of stone walls forming a small enclosure, access way and two triangular pounds funnelling towards the steep banks of the stream. The opposite bank has a gentler slope. Probable sheep washing area.

Condition

Site survives as a low series of walls up to c. 1m high. In riparian zone close to stream. A small amount of conifer and broadleaf regeneration.

Recommendations

Maintain in present condition. Remove regenerating conifers and broadleaves. Potential for simple public presentation as it is close to an established picnic area.

Part of	0	NPRN	0	District	Canolbarth
			SAM		
Enclosure			Medieval	NGR	SN8510089590

Description

Series of banks and enclosures, partly shown on OS map of 1903. Possible association with the Cistercian grange at Cwm Biga. Named Cwm Biga Uchaf on 1st ed 1" map.

Condition

The site is located in mature conifer canopy. The northern part is close to the road.

Recommendations

Maintain in present condition. Care should be taken when removing trees to avoid damage to the banks. Avoid use of heavy machinery. Consider for scheduling.
